LIVER AND BILIARY TRACT

Acute Nonviral Hepatitis and Hepatic Injury

7575 STUDIES ON DAMAGE TO THE LIVER BY ALCOHOL. *(E.)* Trethewie, E. R. (Dept. Physiol., U. Melbourne, Australia). *Med J Aust* 57(19):932-935, 1970.

The effect of alcohol on the release of histamine from the perfused canine and feline livers was investigated. Histamine was released by the dog liver injected intraportally with ethyl alcohol (1 ml/70 g of liver), but not by the cat liver. Histological changes, with an increased number of cells in the portal tracts were normally found in both cats and dogs, the changes being more significant and appearing sooner in the latter. Cloudy swelling of the liver parenchyma, and in some areas, small round cells which largely replace diffusely degenerating liver cells, may be produced by alcohol. Antihistamines may be useful in treating patients suffering from alcoholic intoxication, as it may inhibit cirrhosis.

7576 HISTOCHEMICAL LOCALIZATION OF VARIOUS ENZYMES IN HUMAN FATTY LIVER CAUSED BY MODERATE ALCOHOL CONSUMPTION. *(E.)* Petersen, P. (U. Hosp. Copenhagen, Denmark). *Acta Path Microbiol Scand* 78(2):161-168, 1970.

Biopsy specimens from 24 patients (20 men, 4 women, 20 to 76 yr) with fatty liver due to moderate alcohol consumption were used for histochemical determinations of acid phosphatase, alkaline phosphatase, ATPase, non-specific esterase and various oxidative enzymes. Control specimens were obtained from 5 patients with lymphadenopathy, 4 of whom had sarcoidosis Boeck with only a single granuloma found in the liver biopsy. Demonstration of lysosomal changes by the acid phosphatase reaction indicated degenerative changes in the fatty livers, and non-specific esterase and oxidative enzyme reactions demonstrated both degenerating and regenerating cells. Mitochondrial damage was indicated by a lack of enzyme activity in the cells and morphological changes in the reaction product of NADH-diaphorase. Changes in ATPase and alkaline phosphatase activities were localized in areas in which biliary capillaries were displaced in some of the fatty livers.

7577 PYRAZOLE AND INDUCTION OF FATTY LIVER BY A SINGLE DOSE OF ETHANOL. *(E.)* Bustos, G. O. (Dept. Pharmacol., U. Toronto, Ontario, Canada), H. Kalant, J. M. Khanna and J. Loth. *Science* 168(3939):1598-1599, 1970.

The administration of pyrazole (272 mg/kg i.p.) 10 min before ethanol administration (4 g/kg by stomach tube) to female rats prevented ethanol disappearance from the blood up to 16 hr (593 mg/100 ml for pyrazole-treated and 160 mg/100 ml for control animals at 16 hr). Pyrazole also prevented the reduction in the ratio of hepatic NAD to $NADH_2$ produced by ethanol alone (2.98, 1.32, resp.). However, pyrazole did not prevent the accumulation of hepatic triglycerides caused by ethanol (control, 29.17; pyrazole-treated, 32.13 mg/g liver).

7578 PREVENTION OF THE ETHANOL-INDUCED FATTY LIVER IN THE RAT BY PHENOBARBITAL. *(E.)* Isselbacher, K. J. (Massachusetts Gen. Hosp., Boston), R. S. Koff, E. A. Carter and S. Lui.

The effect of phenobarbital (80 mg/kg, daily for 4 days) on the prevention of the ethanol-induced (4.8 g/kg, single dose) fatty liver in the female rat was investigated by liquid scintillation counting, enzyme assay, and electron microscopy. Although hepatic triglyceride levels were similar in saline- and phenobarbital-pretreated control animals given intragastric saline (4.8 and 4.7 mg/g, resp.), in the group pretreated with phenobarbital there was only a mild increase (6.2 mg/g) in triglycerides after ethanol administration as compared to the 3-fold increase (15 mg/g) noted in the ethanol only group. There was a progressive diminution in hepatic triglyceride accumulation with increased duration of phenobarbital pretreatment. The inhibition of fatty liver was associated with a striking elevation of blood ethanol levels and no increase in blood lactate, and the enhanced incorporation of fatty acid into triglyceride by microsomal preparations after *in vivo* ethanol administration (3-fold) did not occur in phenobarbital-pretreated animals. Oxidation of 1-^{14}C-ethanol in liver slices from pretreated rats at 3 different ethanol concentrations (5.6, 56.0, 28.0 μmoles/ml) revealed a lower rate of $^{14}CO_2$ production in the phenobarbital-pretreated group (% inhibition: 53, 35, 47, resp.). However, ethanol oxidation by hepatic microsomes was similar in phenobarbital-and saline-pretreated rats and was not affected by addition of phenobarbital *in vitro*. The inhibitory effect of phenobarbital pretreatment on the ethanol-induced fatty liver is apparently due to inhibition of the alcohol dehydrogenase-mediated oxidation of ethanol.

7579 INHIBITION OF THE ACUTE ETHANOL-INDUCED FATTY LIVER BY PYRAZOLE. *(E.)* Morgan, J. C. (Tulane U. Sch. Med., New Orleans, La.) and N. R. Di Luzio. *Proc Soc Exp Biol Med* 134(2):462-466, 1970.

The effects of pyrazole administration (36 mg/100 g) on the induction of the acute ethanol-induced (6 g/kg in a 40% solution) fatty liver and the CCl_4 -induced fatty liver were studied to determine the specificity of the pyrazole-induced inhibition of ethanol-induced hepatic injury. The administration of ethanol to pyrazole-treated rats was associated with a profound inhibition of ethanol metabolism as reflected by the sustained levels of ethanol (pyrazole-ethanol group, 192 mg/100 ml; saline-ethanol group, 28 mg/100 ml). Following ethanol administration, there was a 5-fold increase in liver triglyceride concentration at the end of 20 hr (control, 4.3 mg/g; treatment, 20.7 mg/g). The pyrazole-treated group which received ethanol, however, manifested unaltered liver triglyceride concentrations and plasma triglyceride concentrations were not significantly altered in any of the experimental groups. Forty-four hr after ethanol administration, the saline-ethanol group had normal liver triglyceride values as did the pyrazole-treated group, indicating that pyrazole did not merely delay the onset of liver triglyceride alterations, but effectively prevented the development of acute fatty liver. The administration of CCl_4 to pyrazole-treated rats resulted in liver triglyceride elevations which were (24.7 mg/g) comparable to the saline-treated CCl_4 group (26.6 mg/g). The pronounced plasma hypotriglyceridemia manifested in CCl_4-treated animals (13.2 /100 ml) was also not significantly altered in the pyrazole group (10.5 mg/100 ml), showing that the toxic effects of CCl_4 were not modified by pyrazole administration.

7580 STUDIES OF MYOINOSITOL: VI. EFFECT OF MYOINOSITOL ON PLASMA LIPOPROTEIN METABOLISM OF RATS SUFFERING FROM FATTY LIVER. *(E.)*

Hasan, S. H. (Fac. Med. U. Nagoya, Japan), A. Kotaki and K. Yagi. *J Vitamin* 16(2):144-148, 1970.

The effect of myoinositol on the plasma lipoprotein metabolism of rats suffering from Handler's fatty liver was investigated. Myoinositol administered in addition to the B vitamin complex which was given to fatty liver controls obviously lowered the extent of fat accumulated in the liver (control 205.5 mg/g; treatment 97.2 mg/g). After the injection of 1-^{14}C-acetate and 2-^{14}C-acetate, there was a significant difference in the rate of cholesterol labeling, and higher label incorporation was found in rats treated with myoinositol (control 220, 2,794 cpm/mg; treatment 504, 4,376 cpm/mg, resp.). The specific radioactivities of microsomal protein in myoinositol groups 1 hr after injection of ^{14}C-L-leucine were higher than those of fatty liver controls (control 7,074 cpm/mg N; treatment 13,515 cpm/mg N). Four hr after injection, however, the specific radioactivity of serum lipoprotein in myoinositol-treated groups began to fall compared to fatty acid controls (control 14,097; treatment 11,000), indicating that by curing the fatty liver with myoinositol, the rate of turnover of hepatogenic lipoprotein increased. The specific radioactivity of microsomal trichloroacetic acid-insoluble protein following C^{14}-leucine injection was greater in rats treated with myoinositol (5,802 cpm/mg N) than in untreated rats (3,448 cpm/mg N). Apparently the transport of hepatogenic cholesterol into the blood stream was considerably enhanced when fatty liver was cured by the action of injected myoinositol.

7581 CHOLESTASIS IN HUMAN LEPTOSPIROSIS: A CLINICAL, HISTOCHEMICAL, BIOCHEMICAL AND ELECTRON MICROSCOPY STUDY BASED ON LIVER BIOPSIES. *(E.)*

De Brito, T. (Inst. Trop. Med., Sao Paulo, Brazil), D. O. Penna, S. Hoshino, V. G. Pereira, A. C. P. G. Caldas and W. Rothstein. *Beitr Path Anat* 140(3):345-361, 1970.

Liver biopsies from 9 patients with leptospirosis were studied by clinical, morphological, histochemical and biochemical methods. Four patients with reduced succinic dehydrogenase activity also presented severe hepatocellular injury as seen by electron microscopy but the remainder, corresponding to less marked hepatocellular injury, showed normal enzymatic activity. The severity of the disease depended more on the degree of renal dysfunction than on the intensity of the hepatocellular injury; no correlation was demonstrated between the clinical severity and morphological and/or functional hepatic impairment. The pathological process was extemely diffuse, although the more severe changes, particularly regarding the endoplasmic reticulum, were located at the centrolobular areas. Portal spaces with damaged ductules and mild chronic inflammatory infiltrate were less frequently seen than normal ones or portal spaces showing only edema. The ductules usually showed lesions characterized by partial lack and/or distortion of microvilli, with or without lumen dilation and/or bleb formation. Capillaries and small vessels at the portal spaces exhibited swollen endothelial cells with many pinocytotic vesicles. Biliary capillaries were usually dilated containing bile thrombi and showing cytoplasmatic diverticula and a lumen partially or totally devoid of microvilli. Golgi complexes, when abnormal exhibited dilated vesicles with an electron dense material inside. Kupffer cells were hyperplastic and hypertrophic with many autophagic vacuoles, sometimes containing bile. The more prominent and frequent pathological finding was the predominance of smooth reticulum which was proliferated and with dilated cisternae A partial or total glycogen depletion was observed in the more severely injured hepatic cells and mitochondri were enlarged with a few cristae and a light matrix, and microbodies were markedly increased in number. Cholestasis in leptospirosis is apparently the result of an injury to the hepatocyte and its bile secretory apparatus, mediated by an unknown factor, such as a toxin and/or faulty oxygen supply to the cell due to widespread capillary damage.

LIVER AND BILIARY TRACT

Acute Viral Hepatitis

99 AUSTRALIA ANTIGEN IN SOME ACUTE AND CHRONIC LIVER DISEASES. *(It.)* Naccarato, R. (Dept.
l. U. Padua, Italy), U. Fagiolo, R. Farini and M.
laramonte. *G Clin Med* 51(3):170-179, 1970.

The presence of serum hepatitis antigen in sera of 264 patients with various liver diseases was tested in order to determine its incidence in acute viral hepatitis and its relation to other liver diseases of unknown etiology. A positive test was obtained in 41% of 65 acute viral hepatitis patients in the first week of the onset of the disease and decreased to 18% during the 8th week when all biochemical tests became normal. Positive tests were found in 75% of transfusion hepatitis (3 cases), and in 73% of viral hepatitis (17 cases) of prolonged course. Chronic hepatitis revealed a positive test in 34% of the cases, while alcoholic liver cirrhotics (68 cases), liver tumor patients (8 cases) and other liver patients had negative tests. The close relation between serum hepatitis antigen and viral hepatitis was confirmed, while no relation could be established between the prolonged biochemical alterations and the antigen persistence.

7600 HEPATITIS-ASSOCIATED (AU/SH) ANTIGEN DETERMINATION IN 10,000 PATIENTS IN A COPENHAGEN GENERAL HOSPITAL. *(E.)* Lous, P. (Bispebjerg Hosp., Copenhagen, Denmark), H. Olesen and P. Skinhoj. *Lancet* 2(7664):119-121, 1970.

Blood from 10,000 consecutively admitted patients at Bispebjerg Hospital, Denmark was investigated for hepatitis-associated antigen by the Ouchterlony double-diffusion method of Prince or by the precipitin reaction in gel electrophoresis. The antigen was detected in 35 of the patients (22 men and 13 women) whose average age was younger than the average age of patients admitted to the hospital (15 patients were 15 to 44 yr old, 16 were 45 to 64, and only 4 were over 65), and occurred predominantly (60%) in patients admitted to surgical departments. Of the 35 patients with positive tests, 6 had acute hepatitis, 7 had chronic hepatitis or hepatic cirrhosis, and 22 had no indications of liver disease, but 5 of the 35 were on corticosteroid treatment (compared to 1% for all admitted patients) and 3 of the highest figures (67, 88, and 154 units) in the hepatitis-associated antigen quantitation were among these 5 patients.

LIVER AND BILIARY TRACT

Chronic Hepatitis

524 STUDY ON AUTOIMMUNE PHENOMENON IN LIVER DISEASES: BLASTOID CELL TRANSFORMATION OF MPHOCYTES CULTURED WITH AUTOLOGOUS LIVER HOMOGENATE. .) Shishido, H. (Tokyo Med. Dent. U., Japan), H. omoto and M. Okuda. *Bull Tokyo Med Dent Univ* (1):9-18, 1970.

astoid cell transformation was studied by culturing mphocytes taken from 55 patients with chronic liver sease (27 with chronic hepatitis, 28 with liver rrhosis) in a medium containing autologous liver mogenate obtained by needle biopsy. Control subcts included 10 patients without liver disease and healthy individuals. Addition of saline to the lture medium produced 0.2% blastoid cell transrmation in only 1 of the 27 chronic hepatitis patients. Addition of autologous liver homogenate to the culture produced blastoid cell transformation in 9 of the 27 chronic hepatitis patients (0.2% to 5.8%, average 2.4%) and in 10 of the 29 cirrhotic patients (0.2% to 7.4%, average 2.5%); addition of phytohemagglutinin produced a 35-54% blastoid transformation in every instance. The SGOT, SGPT and BSP values were significantly higher in patients with a positive response; marked infiltration of small lymphocytes and liver cell necrosis was also demonstrated. Patients with a positive blastoid cell response had a tendency toward a poor prognosis and also demonstrated a positive rheumatoid serum reaction, indicating a close correlation between the 2. It was suggested that the lymphocytes, sensitized by the patient's own liver, play a role in the mechanism of self-perpetuation of hepatitis.

LIVER AND BILIARY TRACT

Cirrhosis

7631 LACTULOSE TREATMENT OF CHRONIC HEPATOPORTAL ENCEPHALOPATHY: A CLINICAL AND ELECTROENCEPHALOGRAPHIC STUDY. *(E.)* Rorsman, G. (U. Hosp., Lund, Sweden) and I. Sulg. *Acta Med Scand* 187(5):337-346, 1970.

The effect of lactulose treatment on 3 patients with chronic hepatoportal encephalopathy was investigated clinically and electroencephalographically. No demonstrable signs (clinically or electroencephalographically) of encephalopathy were present in any of the three patients (portal cirrhosis, hepatic cirrhosis, and combined lupoid hepatitis and early cirrhosis) prior to portocaval anastomosis; however, at various times following the operation the patients suffered from impaired memory function, tiredness, dizziness, episodic confusion and presented an abnormal (decreased frequency index) electroencephalogram. In all 3 patients the lactulose treatment was preceded by a period of dietary protein restriction, during which time all patients improved clinically and their EEG abnormalities diminished. Daily protein was then increased from 60 to 80 g/day before the trial with lactulose was started, which resulted in a definite exacerbation of the neuropsychiatric symptoms and in a slowing of the EEG (5.6 c/sec). While maintaining the high protein intake, lactulose treatment (range: 40-150 ml/day, Duphalac) was begun and a regression of the clinical symptoms and an improved EEG (8.8 to 10.1 c/sec.) resulted. The neuropsychiatric symptoms in all cases correlated well with the electroencephalographic index.

7632 ZINC CONCENTRATION IN NORMAL AND CIRRHOTIC LIVERS. *(Ger.)* Essing, H. G. (Inst. Occupational Med., U. Erlangen-Nuremberg, Germany), P. Skilandat, K. H. Schaller and D. Szadkowski. *Aertzl Forsch* 24(7):193-196, 1970.

Zinc concentrations were determined in 28 normal and 15 cirrhotic liver tissue samples in order to study the relation between Zn metabolism and chronic liver parenchymal damage. In 24 cases zinc levels were related to DNA levels in order to avoid errors due to variable blood content of the tissue samples. Normal liver samples had mean values of 31.3 mg zinc/100 g (dry weight) and 0.26 mg zinc/mg DNA, while cirrhotic samples had mean values of 19.8 mg zinc/100 g (dry weight) and 0.14 mg zinc/mg DNA. Zinc levels seem to be considerably lower in liver tissue with parenchymal damage.

7633 LIFE-EXPECTANCY OF DECOMPENSATED HEPATIC CIRRHOSIS PATIENTS. *(Ger.)* Selmair, H. (St. Hosp. Kassel, Germany), V. Ilic and K. Raddatz. *Munchen Med Wschr* 112(26):1241-1244, 1970.

A 5 yr study of 212 patients with decompensated liver cirrhosis, revealed a male/female ratio of 3/1. The survival rate 1 yr following decompensation was 57%, 32% after 3 yr and 27% after 5 yr. No differences in life expectancy following decompensation were noticed between alcoholic and "hepatic" (posthepatic or cryptogenic) cirrhotic patients.

The most frequent cause of death was hepatic coma (59%); hemorrhage of esophageal varices produced death in 24% of cases and coma following hemorrhage was fatal in 10% of the cases. These results appear more favorable when compared to any other published data, suggesting that careful medical management may increase the life expectancy of the decompensated cirrhotic patient.

7634 SERUM LIPIDS AND TOTAL FATTY ACIDS IN CHRONIC ALCOHOLIC LIVER DISEASE AT DIFFER-
ENT STAGES OF CELL DAMAGE. *(E.)* Marzo, A. (Simes
ab. Biochem., Milan, Italy), P. Ghirardi and D.
ardini. *Klin Wschr* 48(15):949-950, 1970.

ipid classes and per cent composition of total fatty acids were determined in the serum of normal ubjects (20) and patients (90) with chronic alco-
olic liver disease. The disease was classified in stages according to histological findings: cloudy welling, fatty metamorphosis, steatosis, interstitial hronic hepatitis, and cirrhosis. Total free fatty cids increased 30% to 50% in the last 4 stages, nd in all 5 stages of liver disease a marked increase n percentages of mono-unsaturated fatty acids was oted. The increase of free fatty acids in the erum occurred earlier than increases in the other ipid classes; triglycerides increased by 26% in he second stage and to a lesser extent in the other tages. Total cholesterol, phospholipids and total ipids ranged within normal values in the first 4 tages, decreasing by 20% to 30% in cirrhosis possi-
ly because of a decrease in liver activity.

LIVER AND BILIARY TRACT

Gallbladder and Biliary Tract Diseases

7651 ACUTE CHOLECYSTITIS AND SERUM TRANSAMINASE ACTIVITY. *(E.)* Adams, J. T. (U. Rochester Med. Ctr., N. Y.), G. H. Clermont and S. I. Schwartz. *Arch Surg* 101(3):366-369, 1970.

The increment and time course of SGOT in 108 patients with acute cholecystitis (26 were jaundiced) were evaluated for usefulness in the differential diagnosis of acute cholecystitis from acute myocardial infarction or hepatitis. An elevated SGOT (188 Karmen U/ml) was seen in 83 of the 108 patients. All of the 26 jaundiced patients had elevated SGOT as did 19 of the 22 patients with common duct stones. SGOT elevations above 300 U/ml were seen in 18 patients (10 were jaundiced and 5 had common duct stones) and in 5 of these patients, the value was more than 600 U. In 57 of the 82 anicteric patients there was an increase in SGOT activity with a peak value of 644 U and a mean of 159 U whereas in the jaundiced patients, the value was 251 U. In 8 jaundiced patients with common duct stones, the average SGOT value was 264 U, while in the 18 jaundiced patients without stones it averaged 245 U. Serial enzyme determinations were obtained over a period of 5 days in 38 anicteric patients and 22 jaundiced patients whose SGOT was elevated and invariably, the initial SGOT value was the maximal level obtained. When compared to the increment and the time course of the SGOT of patients with acute myocardial infarction or hepatocellular disease, the elevated SGOT activity which characterizes patients with acute cholecystitis can be of value in the differential diagnosis of these diseases.

7652 HISTOLOGICAL CHANGES IN HUMAN LIVER BIOPSIES FOLLOWING EXTRAHEPATIC BILIARY OBSTRUCTION. *(E.)* Christoffersen, P. (Commun. Hosp., Copenhagen, Denmark) and H. Poulsen. *Acta Path Microbiol Scand* (Suppl. 212):150-157, 1970.

Liver biopsies from 39 patients with cholestasis due to obstruction of extrahepatic bile ducts and with jaundice of known duration were examined histologically and the findings were correlated with the degree and duration of the jaundice. Marginal bile duct proliferation was found in all biopsies and in 82% of the portal areas; lymphocyte and histiocyte infiltration was also seen. Neutrophilic granulocytes were present in 26 of the 39 biopsies and in 40% of the portal areas; edema was also present in 21 of 39 biopsies and in 37% of the portal areas and cholestasis, focal Kupffer cell proliferation, slight variations in the size of the liver cells in the parenchyma, fine focal liver cell necroses and acidophilic bodies were also encountered. While a correlation between the histologic findings and the duration of the jaundice (1 to 2 months) did not reveal any positive differences, coarser bile thrombi, more Kupffer cells with bile, and more portal areas with edema and neutrophilic granulocytes were seen in cases with severe rather than with slight jaundice.

7653 EPITHELIAL GLYCOPROTEINS OF HUMAN GALLBLADDER: IMMUNOLOGICAL CHARACTERIZATION. *(E.)* Hakkinen, I. (Surg. Clin. U. Turku, Finland) and M. Laitio. *Arch Path* 90(2):137-142, 1970.

Specific rabbit antisera were induced for the immunological characterization of glycoproteins isolated from mucosal extracts of 38 surgically-removed human gallbladders and from 20 bile samples. The unfractionated saline extract from the gallbladder mucosa as antigen resulted in antiserum directed against connective tissue components only, which contained apparently the most powerful antigens of the extract, and cross-reacting antibodies against human serum proteins were also present. Aceytlpyridinium chloride extract of the gallbladder mucosa contained acid glycoproteins which induced an antiserum specific for gallbladder epithelium. Of the 3 gastrointestinal antigens found in gallbladder mucosa, normal gastric sulfoglycoprotein antigen and an intestinal antigen was also always present in the normal epithelial cells and could be found readily in bile and mucosal extracts in varying amounts while a third antigen was found only in pseudopyloric glands and cells resembling gastric superficial cells. This latter antigen was normally found in neutral glycoproteins of the gastric glands but not in the gallbladder, suggesting a relation between the presence of neutral glycoproteins and pathological conditions in the gallbladder.

7654 ROUX-EN-Y JEJUNAL LOOP IN BILIARY AND PANCREATIC SURGERY.

(Fr.) Hollender, L. F. (C. H. U. Strasbourg, France), H. Gillet and J. J. Kohler. *Chir Gastroent* 4(2):175-194, 1970.

The Roux-En-Y (excluded jejunal loop) procedure was performed in 54 cases of cholelithiasis with complications, 15 cases of cancer of the common bile duct and in 11 cases of cicatrix stenosis; the technique was also applied in 43 pancreatic surgery cases with chronic pancreatitis. The procedure presents considerable advantages compared to choledochoduodenostomy in preventing intestinal biliary reflux in the first group and formation of pancreatic fistulae in the second group.

7655 SIGNIFICANCE OF THE LIVER IN THE PRODUCTION OF LITHOGENIC BILE IN MAN.

(E.) Vlahcevic, Z. R. (VA Hosp., Richmond, Va.), C. C. Bell, Jr. and L. Swell. *Gastroenterology* 59(1):62-69, 1970.

The bile acid, cholesterol, and phospholipid composition of gallbladder and hepatic bile and the cholesterol composition of gallstones were determined in 20 patients at the time of elective biliary surgery. Gallstone analysis verified 3 distinct groups: 14 patients with cholesterol gallstones (10.1 to 92.7% cholesterol) and with approximately the same percentages of cholesterol in both the gallbladder (12.5%) and hepatic (14.5%) bile; 4 patients with pigmented gallstones (less than 0.3% cholesterol) and with gallbladder (4.7%) and hepatic (6.1%) bile cholesterol considerably lower than that of the first group; and 2 patients without demonstrable gallstones but with gallbladder (11.0%) and hepatic (12.1%) bile cholesterol levels similar to that of the first group. An evaluation of the interaction of cholesterol, bile salts, and phospholipid in the micellar solubilization of biliary cholesterol (triangular phase coordinates) revealed that the gallbladder and hepatic bile of group 1 patients were either out of the micellar one or near the line of cholesterol saturation (with he hepatic bile further out of the micellar zone han the gallbladder bile), while both hepatic and gallbladder bile of the patients with pigmented galltones fell within the micellar zone and both hepatic nd gallbladder bile of the patients with no gallstones were outside the micellar zone. Biliary bile acid composition isolated from gallbladder and hepatic bile was not significantly different by the paired t-test lthough patient to patient variation was considerable. he liver appears to be the principal site for abnormal ile formation associated with cholesterol gallstones.

7656 SOURCE OF ABNORMAL BILE IN PATIENTS WITH CHOLESTEROL GALLSTONES.

(E.) Small, D. M. (Boston U. Med. Ctr., Mass.) and S. Rapo. *New Eng J Med* 283(2):53-57, 1970.

The source (gallbladder or liver) of abnormal bile in 30 patients (American Indians of the Southwest) with cholesterol gallstones was investigated. The hepatic bile had much less bile salt, more cholesterol (in a zone where cholesterol would be expected to precipitate) and a lower phospholipid to cholesterol ratio (58.15, 16.58 mole%, 1.61, resp.) than gallbladder bile (71.58, 8.63 mole%, 2.43, resp.). The fact that each hepatic bile sample on inspection immediately after removal at operation (cholecystectomy) appeared as an optically clear solution strongly suggests that the liver of these patients formed a supersaturated bile that at time of collection at surgery had not yet precipitated its excess cholesterol. The liver apparently makes a supersaturated bile that, at some time after reaching the gallbladder, gives up its excess cholesterol in the form of cholesterol crystals and the liver producing this abnormal bile appears normal surgically and has normal function as judged by routine tests.

7677 BACTEREMIA FOLLOWING PERORAL BIOPSY OF THE SMALL INTESTINE. *(E.)* Wenger, J. (VA Hosp., Atlanta, Ga.) and A. M. Petty. *Gastroenterology* 59(1):140-143, 1970.

The possibility that bacteria can pass from jejunal lumen to the systemic circulation following peroral jejunal biopsy was suggested by a case history of a patient developing fever, nausea, and bacteremia within 72 hr after the biopsy. Blood cultures revealed *Escherichia coli*, and small intestinal cultures taken 4 months earlier had revealed a high colony count of gram-negative bacilli; both organisms are abnormal for the upper jejunum. Following treatment with antibiotics, continuous nasogastric suction, and i.v. feeding the patient returned to the prebiopsy state.

7678 ANEMIA IN DERMATITIS HERPETIFORMIS: THE ROLE OF DAPSONE-INDUCED HEMOLYSIS AND MALABSORPTION. *(E.)* Cream J. J. (St. Thomas Hosp. Med. Sch., London, England) and G. L. Scott. *Brit J Derm* 82(4):333-342, 1970.

The prevalence and mechanisms of anemia in cases of dermatitis herpetiformis were studied in 43 patients being treated with dapsone (4,4'-diaminodiphenylsulfone) in this condition. Mean hemoglobin levels of patients were significantly lower than normal controls. Increasing the dose of dapsone to 150 mg. daily or above invariably caused a fall in hemoglobin. Most patients receiving more than 50 mg of dapsone daily showed persistent reticulocytosis which increased when the dose was raised. Red cell fragmentation and macrocytosis were common results in patients receiving 100 mg or more of dapsone, daily. Average massed cell volume of 15 patients receiving from 50-300 mg dapsone daily was 144 μ^3 compared with 95 μ^3 for 30 normal subjects. Serum iron levels, urine iron excretion, serum vitamin B_{12} and serum folate levels were not significantly different between controls and patients. The most important cause for anemia in these patients appeared to be the drug-induced hemolysis which may be due to a greater sensitivity of patients with dermatitis herpetiformis to dapsone.

7679 CALCIUM-STIMULATED GASTRIC SECRETION IN THE ZOLLINGER-ELLISON SYNDROME. *(E.)* Passaro, E., Jr. (Wadsworth Hosp., VA Ctr., Los Angeles, Calif.) and N. Basso. *Arch Surg* 101(3):399-402, 1970.

The effects of hypercalcemia on gastric acid secretion were studied in 4 patients with Zollinger-Ellison syndrome. Calcium gluconate (15 mg/kg i.v.) was infused over 4 hr into the patients who had had vagotomy and partial gastrectomy prior to the study and betazole was also given for comparison of maximal hourly acid outputs. Acid output after calcium stimulation ranged from 10.6 to 62 mEq/hr and from 12-46.6 mEq/hr following betazole administration. Calcium was then given to 5 patients with bilateral truncal vagotomy and partial gastrectomy to test for a direct effect on the parietal cell. In each case a gradual rise in acidity occurred with a peak after the second hour of infusion, indicating that a direct stimulation of the parietal cells by calcium was improbable. Ferrets were used to ascertain whether calcium might potentiate gastrin action, with the result that small amounts of calcium and submaximal doses of pentagastrin given simultaneously caused a maximal response, suggesting potentiation. Calcium may be of diagnostic importance in distinguishing between patients with gastric hypersecretion due to duodenal ulcer and those with hypersecretion caused by excess gastrin activity.

7680 VARIATION IN THE pH OF FECES IN DISEASE. *(E.)* Madanagopalan, N. (Madras Med. Coll., India), S. A. Nadar and R. Subramaniam. *Gut* 11(4):355-357, 1970.

The variation in the pH of feces in disease was investigated in 94 patients (17 control, 23 peptic ulcer, 12 surgically treated peptic ulcer, 4 nonspecific diarrhea, 3 Crohn's disease, 14 ulcerative colitis, 13 ileostomy and 8 abdominal malignancy) by a pH meter and indicator paper. The range of pH observed in the control group was 5.13 to 8.47, only 5 of 23 samples having a pH value of 7.0 or below. The overall pH range in the cases studied was 4.87 to 9.20. Unformed feces tended to be more acidic (27 of 40 more acid than pH 7.0) than formed stools (48 of 73 more alkaline than pH 7.0). The ileostomy specimens were frequently more acidic (pH 7.0 in 12 out of 16 cases). The pH values of the stools of 100 patients with acute amebic dysentery were compared with similar measurements in 67 patients with nondysenteric conditions (peptic ulcer 14, miscellaneous 53). Contrary to expectations the stools of patients with amebic dysentery were alkaline more often than acidic (52 of 100 patients passed stools with a pH of 8.0 or above and only 22 stool specimens had a pH of 6.0 or below). The pH of the feces of the majority of the nondysenteric subjects tended to be more acidic than pH 7.0.

7681 EXPERIMENTAL PROTEIN-CALORIE MALNUTRITION IN RATS: BIOCHEMICAL AND ULTRASTRUCTURAL STUDIES. *(E.)* Enwonwu, C. O. (U. Wash. Sch. Med. Dent., Seattle) and L. M. Sreebny. *Exp Molec Path* 12(3):332-353, 1970.

Rats on a low-protein diet were used as experimental models of kwashiorkor in which biochemical changes in the liver and serum were observed and correlated with anatomical alterations in the liver. Marked losses in body weight, atrophy of the pancreas and spleen, fatty liver, hypoproteinemia, edema and profound changes in serum amino acid patterns associated with extreme disproportions in the fasting levels of amino acids in the liver were observed. A marked reduction in liver protein and RNA content occurred, while DNA remained remarkably constant, indicating loss of cellular contents rather than a decrease in cell population. The decreased RNA content of the liver was consistent with the observations of massive breakdown of the membranes of the endoplasmic reticulum and extensive disaggregation of polysomes as well as the elevated activity of alkaline ribonuclease.

7682 DIGESTIVE MUCOSA AND CONDITIONS OF DISTRESS: EFFICACY OF PROTECTIVE TREATMENT WITH SULPIRIDE. *(Fr.)* Lareng, L. (C. H. U. Poupon, Toulouse, France) and B. Cathala. *Sem Hop Paris* 46(29):34-40, 1970.

The effectiveness of sulpiride, a psychotropic drug acting upon the hypothalamic nuclei, was studied in 52 intensive care patients for its protective action on the gastrointestinal mucosa. No digestive hemorrhage occurred in 44 of the patients treated (300 mg i.m. daily), while 26% of 23 control patients presented gastrointestinal bleeding. Anatomical lesions were found in 44% of the control patients and their incidence was reduced to 15% upon treatment. This protective management of the gastrointestinal mucosa permits simultaneous anticoagulant therapy in resuscitation patients.

7683 EFFECT OF ENDOTOXEMIA ON LIVER CELL MITOCHONDRIA IN MAN. *(E.)* Schumer, W. (U. Illinois Coll. Med., Chicago), T. K. Das Gupta, G. S. Moss and L. M. Nyhus. *Ann Surg* 171(6):875-882, 1970.

Oxidative phosphorylation and respiration were studied in mitochondria (isolated from human liver and from rat liver) that had been rendered endotoxemic by the administration of *E. coli* lipopolysaccharide; one half of the human mitochondrial pellet in the assay medium was incubated with lipopolysaccharide and the other half served as control. Inhibition of succinate-stimulated respiration was most pronounced with the lipopolysaccharide of *E. coli* 026:B6 and 0111:B4 extracted by the Boivin method, whereas Westphal-extracted lipopolysaccharide from the same strains was less inhibitory. In the presence of ADP, the rate of oxygen uptake of the lipopolysaccharide-challenged mitochondria was 40 to 50% lower than in the control group, although in the absence of ADP there was no significant difference between the two groups. The respiratory control indices and the ADP/O ratios for the controls were 2.8 and 2.0, resp., and for the endotoxemic groups, 1.6 and 1.1, resp. Electron micrographs showed swelling and dissolution of the internal structure in both human liver mitochondria and the rat liver mitochondria in the endotoxin challenged groups.

7684 STUDIES ON ACUTE MESENTERIC INFARCTION. *(E.)* Carey, J. P. (Dept. Surg. U. California, Irvine), E. A. Stemmer and J. E. Connolly. *Amer J Gastroent* 53(6):552-557, 1970.

Twenty-one acute experiments were performed in dogs to evaluate the physiological effects of sympathectomy in animals with acute mesenteric arterial insufficiency. Mesenteric ischemia was produced by ligation of the superior mesenteric artery, followed 2 hr later by mesenteric ganglionectomy and periarterial sympathectomy; 3 hr after sympathectomy the occluding ligature was released to simulate the effects of arterial reconstruction. Nine dogs were treated similarly except graduated occlusions (35% to 85% flow reduction) of the superior mesenteric artery were produced. In 6 dogs arterial and mesenteric venous lactate and pyruvate levels were determined during a control period following ligation of the mesenteric artery after sympathectomy and following simulated arterial reconstruction. Sympathectomy was capable of significantly augmenting distal arterial blood flow regardless of the severity of the occlusion except where high degrees of stenosis were present when arterial reconstruction was necessary to return blood flows to normal. Reduction of blood flow to the bowel was associated with characteristic changes in the mesenteric venous pH, pCO_2 and pO_2 levels and both sympathectomy and simulated arterial reconstruction returned these values toward normal. Lactate and pyruvate determinations did not reflect as clear cut a reversal toward control levels but consistently improved following sympathectomy. The most sensitive index of intestinal ischemia was the response of bowel temperature which fell precipitously following severe arterial stenosis and increased within minutes of sympathectomy with a parallel response in blood flow.

7685 A CONTROLLED TRIAL IN TRAVELLERS' DIARRHEA. *(E.)* Richards, D. A. (CIBA Lab., England). *Practitioner* 204(1224):822-824, 1970.

The prophylactic efficacy of clioquinol (entero-vioform) in the treatment of traveller's diarrhea was studied in a single-blind controlled trial of 320 subjects (British professional soccer players) whose trips to various countries average 14.3 to 14.6 days. In a 1968 study of 86 subjects given 3 (250 mg) tablets of clioquinol (53 subjects) or matching placebo (33 subjects) daily, the incidence of diarrhea was 2% and 21% resp., and in a 1969 study of 234 subjects given 4 (250 mg) tablets of clioquinol (148 subjects) or placebo (86 subjects), the incidence was 7% and 27% resp. The average duration of diarrhea over both studies was 31.6 hr with clioquinol and 47.3 hr with placebo.

7686 HEMOPOIETIC FACTORS OF THE GASTRIC JUICE IN CHRONIC DISEASES OF THE GASTROINTESTINAL TRACT. *(Rus.)* Fuzailov, Yu. M. (Tashkent Med. Inst., Tashkent, USSR) and Kh. Bekturdiyev. *Ter Arkh* 42(3):33-36, 1970.

DESCRIPTION OF INDEXES

SUBJECT and AUTHOR INDEXES for Gastroenterology Abstracts and Citations, Volume 5, are produced from on-line computer print-out of key-punched cards.

The SUBJECT INDEX is based on a hierarchial system of classification in which *major index terms* are modified by one or more *key word descriptors*. The *key word descriptors* are listed in decreasing order of importance and describe the content of the abstract or citation. In addition, in this indexing system, some *key word descriptors* will also be used as *major index terms*, thus providing in-depth indexing of each document. An abstract or citation number, in brackets, will be found after the *key word descriptors*. Abstracts will be identified by an asterisk outside of the brackets.

An illustrative example of this indexing system follows:

INTESTINE, LARGE

Colon, Carcinoma, Radiological Detection, Rectum (0188)*

COLON

Cancer, Polyps, Radiological Detection (0188)*

RECTUM

Cancer, Polyps, Precancerous (0188)*

CANCER

Large Intestine, Detection, Radiology (0188)*

DIAGNOSIS

Radiology, Cancer, Large Intestine (0188)*

Numbers followed by an asterisk refer to abstracts in the text. Other numbers refer to citations.

SUBJECT INDEX

- ABDOMEN
  - ACUTE, PANCREATITIS, ATHEROSCLEROSIS (7688)
  - DISEASE, DIAGNOSIS, ANGIOGRAPHY, ISOTOPE SCANNING (7220)*
  - HIDDEN INJURIES, DIAGNOSIS (7236)
  - PAIN, INFANCY (7738)
  - PRESACRAL MASSES, RADIOLOGY, CHILDREN (7489)
  - SELECTIVE HYPOTHERMIA, ACUTE PANCREATITIS (7206)
  - TRAUMA, DIAGNOSIS, THERAPY (7255)
  - TRAUMA, INTESTINAL DAMAGE, SURGERY (7714)
  - TRAUMA, MECKEL'S DIVERTICULUM (7417)
- ABSCESS
  - AMEBIC, LIVER (7762)
- ABSORPTION
  - AMINO ACID, VITAMIN D, ALPHA-AMINO-ISOBUTYRIC ACID (7055)*
  - CALCIUM, SMALL INTESTINE, RENAL INSUFFICIENCY (7728)
  - COLON, ELECTROLYTE, PERFUSION, BILE ACID (7060)*
  - DUODENUM, ILEUM, DRUGS, CARBONIC ANHYDRASE (7062)*
  - INTESTINE, DRUG, SALICYLIC ACID, BARBITAL (7071)*
  - LACTOSE INTOLERANCE (7448)
  - LIPID, STOMACH, LIPOLYSIS (7065)*
  - LYSINE, HEAT DAMAGE, GLUCOSE (7064)*
  - PROTEIN, TANNIC ACID (7076)
  - SMALL INTESTINE, RIBOFLAVIN, EXCRETION (7068)*
  - 3-DEHYDRORETINOIC ACID, METABOLISM, BIOLOGICAL POTENCY (7210)
  - VITAMIN B12, PERNICIOUS ANEMIA, ACHLORHYDRIA (7275)
  - WHEAT PROTEIN, LYSINE AND THREONINE, DIGESTION (7054)*
- ACID-BASE
  - ACID INGESTION, CICATRISING LESIONS, SURGERY (7357)
  - TANNIC ACID, PROTEIN, ABSORPTION (7076)
- ACIDITY
  - CALCIUM, ACID OUTPUT, HYPERSECRETION (7679)*
  - GASTRIC, RADIOTELEMETRY (7261)
  - GASTRIC JUICE, ION-EXCHANGE RESINS (7240)
  - STOMACH, SECRETION, HYPEROSMOLAL (7089)*
- ACIDITY TITRATION
  - GASTRIC JUICE, DUODENUM, NEUTRALIZATION (7191)*
- ADENOSINE TRIPHOSPHATE
  - PHOSPHATASE, LIVER, BILE CANALICULAR (7029)*
- ADRENAL
  - CORTEX, CHRONIC PANCREATITIS, ADDISON'S DISEASE (7518)
  - 5-HYDROXYTRYPTAMINE, BORDETELLA PERTUSSIS VACCINE, STOMACH, DUODENUM (7200)
- ADRENALECTOMY
  - LIVER, INDUCTION, TYROSINE AMINOTRANSFERASE, PHENTOLAMINE (7157)*
- ALCOHOL
  - ANESTHESIA, LIVER FUNCTION (7183)
  - CHRONIC LIVER DISEASE, FATTY ACIDS (7634)*
  - DEHYDROGENASE, LIVER, CHELATION, RATE (7140)*
  - DEHYDROGENASE, METABOLISM, LIVER (7126)*
  - ETHANOL, FATTY LIVER, PYRAZOLE (7577)*
  - FATTY LIVER, ENZYME ACTIVITY (7576)*
  - FATTY LIVER, PHENOBARBITAL (7578)*
  - INDUCED FATTY LIVER, PYRAZOLE (7579)*
  - LIVER, CIRRHOSIS, PROTEIN MALNUTRITION (7637)
  - LIVER, MICROSOMES, MITOCHONDRIA (7127)*
  - LIVER DAMAGE, HISTAMINE (7575)*
- AMEBIASIS
  - INTESTINE, EPIDEMIOLOGY, DIAGNOSIS (7755)

PREFACE

GASTROENTEROLOGY ABSTRACTS and CITATIONS is a publication of the National Institute of Arthritis and Metabolic Diseases. This specialized information medium has been initiated to fill an existing great need in the field of gastroenterology and to assist the Institute in meeting its obligations to foster and support laboratory and clinical research into the nature, causes, and therapy of diseases of the gastrointestinal tract. Publication of GASTROENTEROLOGY ABSTRACTS and CITATIONS makes available citations of all current papers relevant to this field from medical journals published throughout the world. Approximately one-third of the citations dealing with the major aspects of gastroenterology have accompanying abstracts.

The issuing of GASTROENTEROLOGY ABSTRACTS and CITATIONS under the auspices of the National Institute of Arthritis and Metabolic Diseases will provide a much needed current awareness tool to scientists and will facilitate greater integration of research and clinical efforts in this field. The number and great diversity of publications in the area of gastroenterology makes it imperative that an appropriate service be available to investigators and practitioners so that they may be apprised of progress with a minimum of delay. Our aim is to provide the readers with a readily systematized compilation of current published work. The publication will provide the greatest usefulness if these interested investigators will contribute their ideas and comments for consideration whenever possible.

GASTROENTEROLOGY ABSTRACTS and CITATIONS is published monthly and includes citations and abstracts from the biomedical world literature as they are currently received. In addition, yearly cumulated subject and author indexes are published.

This publication is available free to National Institutes of Health grantees and contractors working in the field of gastroenterology and libraries of medical schools. Requests from these qualified individuals to receive free copies of this publication must include their grant or contract number and the title of their project. These requests as well as address changes and other communications should be addressed to:

Scientific Communications Office
Gastroenterology Abstracts and Citations
National Institute of Arthritis and Metabolic Diseases
National Institutes of Health
Bethesda, Maryland 20014

Other individuals and libraries may receive this publication by subscribing *directly* to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Subscription price per year in the United States, Canada, and Mexico, $16.00; foreign, $4.00 additional; and $1.25 for a single copy. Payment is required in advance, and check or money order should be made payable to the Superintendent of Documents.

PRE-CLINICAL SCIENCES

MORPHOLOGY, CELLULAR STRUCTURE AND HISTOCHEMISTRY

7771 FREE LYSINE COMPARTMENTS IN RAT LIVER CELLS.

(E.) Portugal, F. H. (Natl. Inst. Hlth., Bethesda, Md.), D. H. Elwyn and H. Jeffay. *Biochim Biophys Acta* 215(2):339-347, 1970.

The distribution and metabolism of lysine in rat liver nuclear, mitochondrial, microsomal, and cytoplasmic fractions were studied, and the distribution and amount of free lysine in each pool were determined. Rats were also infused with ^{14}C-lysine for up to 180 min *in vivo*, and the specific activity of lysine in each cell fraction was determined by column chromatography. The amount of lysine in the mitochondria and other cell organelles (0.02-0.03 μmole/g liver) was considerably less than in the cytoplasm (0.32 μmole/g liver). The free lysine in the particles was not completely exchangeable with the cytoplasmic lysine; the intramitochondrial free lysine specific activity after 60 min of infusion was only about 60% of the specific activity for cytoplasmic lysine. An apparent division of the total lysine pool of the tissue into at least two smaller compartments, one in the cytoplasm and another in the mitochondrial fraction, seems to exist in rat liver cells.

7772 FURTHER OBSERVATIONS ON THE PRINCIPAL GLYCOPROTEIN OF THE GASTRIC SECRETION.

(E.) Schrager, J. (Roy. Albert Edward Infirm., Wigan, Lancashire, England) and M. D. C. Oates. *Digestion* 3(4):231-242, 1970.

A study of the carbohydrate composition of the gastric glycoprotein constituting the non-retarded fraction of gastric secretion eluted on Bio-gel P150 was made on 53 individual gastric aspirations. The carbohydrate component was common to all glycoproteins of the non-retarded fraction showing the following quantitative relationship: galactose/glucosamine/galactosamine = 4/3/1 (molar ratios). The basic structure of the side chains was made up of 4 repeating disaccharide units, each unit being composed of a galactose and an N-acetyl hexosamine. The hexosamine in 3 units was a galactosamine and the hexosamine in the unit nearest to the protein core was a galactosamine. Superimposed on the common basic structure were terminal sugar residues which divided the investigated glycoprotein into distinctive groups endowing them with blood group specificity. Among other distinguishing features of this glycoprotein were a high carbohydrate content (80-85%), the presence of galactosamine and lack of mannose, a characteristic amino-acid composition with quantitative relationships between galactosamine, threonine and serine.

7773 LIVER ULTRASTRUCTURE AND RNA LABELING AFTER PARTIAL HEPATECTOMY IN PROTEIN-FED AND PROTEIN-DEPRIVED RATS.

(E.) Stenram, U. (Dept. Path., U. Uppsala, Sweden), H. Nordgren and R. Willen. *Virchows Arch Zellpath* 6(1):12-23, 1970.

Ultrastructural changes and RNA labeling after partial hepatectomy (sham-operated controls) were studied in rats which were pair-fed on a protein-free or a 25% casein diet for 14 days prior to surgery. Both dietary groups of hepatectomized rats showed about the same degree of regeneration of rough-surfaced endoplasmic reticulum and polysomes, and the same enlargement of nucleoli; the nucleoli of the regenerating livers of protein-deprived rats often showed an increase in the granular component. The RNA labeling after cytidine-^3H administration, studied by radioautography and by polyacrylamide-agarose gel electrophoresis of total liver and a cytoplasmic fraction, was heavier in all parts of the liver cell in protein-deprived rats as compared to protein-fed rats and heavier in hepatectomized than in sham-operated rats. No delay in the appearance of 29 and 18S ribosomal RNA in the cytoplasm in protein-deprived and hepatectomized rats was seen. The protein-deprived rats apparently have a good ability to regenerate liver cell structures after partial hepatectomy, and their enlarged liver cell nucleoli have a high synthesis of RNA, and the processing and delivering of nucleolar RNA to the cytoplasm proceeds in a normal way.

7774 IMMUNOCHEMICAL CHARACTERIZATION OF SUBMICROSOMAL RAT LIVER ESTERASES.

(E.) Raftell, M. (Wenner-Gren Inst., Stockholm, Sweden) and C. Powell. *Immunochemistry* 7(7):619-626, 1970.

For characterization of antigens with nonspecific esterase activity present in rat liver microsomes antigens from 3 submicrosomal rat liver fractions (R, Sa and Sb) were investigated for esterase activity in immunoelectrophoretic experiments with rabbit antisera against each of the subfractions. The esterases were further classified as carboxyl-, aryl-, acetyl- or choline esterases by their sensitivity to inhibition by 10^{-3}-$10^{-4}M$ DFP (diisopropylfluorophosphate), $10^{-4}M$ eserine, 10^{-2}-$10^{-4}M$ PCMB (p-chloromercuribenzoate), heat and 10 *M* urea. The fractions R and Sa contained at lease 3 acetyl esterases and 5 carboxylesterases, while only 1 acetyl esterase and 2 carboxyl esterases were detected in the Sb fraction; no aryl- or choline esterases were found in any of the fractions. Liver microsomes were shown to have one carboxyl esterase in common with kidney microsomes and one acetyl esterase in common with testes microsomes. Short chain fatty acids were more easily attacked by the esterases of liver microsomes than long chain fatty acids. The activity of one esterase active antigen classified as carboxyl esterase and occurring in three variants of identical electrophoretic mobility, was strongly increased in the R and Sa membranes by phenobarbital treatment; in the Sb membranes, this antigen was entirely missing. Two of the variants were also shown to be present in kidney microsomes where phenobarbital did not provoke any enhancement, which suggests that the enhancement seen in liver microsomes of phenobarbital-treated rats reflects a step in drug detoxification.

7775 POLARIZATION OF MITOCHONDRIA IN THE ABSORPTIVE CELLS OF THE SMALL INTESTINE OF SUCKLING RATS: LIGHT AND ELECTRON MICROSCOPY STUDY.

(E.) Gonzalez-Licea, A. (Natl. Med. Ctr., I.M.S.S., Mexico City, Mexico). *Lab Invest* 23(2):163-167, 1970.

Differences in the location and in the internal structure of mitochondria in the absorptive cells of the small intestine of suckling rats, fasted suckling rats, and fetuses were described. Only 4% of the mitochondria of the suckling rats were found in the upper half of the absorptive cell compared to the 97% found in the fetus and fasted rats. The mitochondria of the suckling rats were rod-shaped and contained numerous cristae arranged perpendicularly to the long axis of the cell; in the fasted suckling rats the mitochondria were also rod-shaped but slightly longer than those of the suckling rat and contained less cristae, often situated parallel to the long axis, and the mitochondrial matrix was less dense; the mitochondria of the fetus were either round or rod-shaped, contained very few cristae arranged perpendicularly to the long axis, and had a pale matrix. The displacement and intramitochondrial changes in the intestinal cells of suckling animals may be indicative of the amount of metabolic activity occurring, possibly due to the extraction of milk components from the absorptive cells of the jejunum.

7776 LIVER UDP-GLUCURONIC ACID PYROPHOSPHATASE ACTIVITY DURING DEVELOPMENT. *(Ger.)*

Schroter, W. (U. Child. Clin. Hamburg, Germany). *Z Kinderheilk* 108(2):93-102, 1970.

Activity of UDP-glucuronic pyrophosphatase was determined in liver microsomal suspensions from guinea pigs and rats. Activity related to microsomal protein content of new born (1-day-old) guinea pigs was 10% of that of adult animals; enzyme activity of newborn (4- and 7-day-old) rats was 20% that of adult rats. Activity of microsomal preparations kept at -16°C remained stable for 7 days, and then declined slowly. This reduction was not related to the earlier decline of glucuronyl transferase activity during cold storage. The activation of glucuronyl transferase by ATP seems not to be related to inhibition of UDP-glucuronic acid hydrolysis by UDP-glucuronic pyrophosphatase.

7777 HISTOCHEMICAL DEMONSTRATION OF HYDROCHLORIC ACID IN THE GASTRIC TUBULES OF TELEOSTS USING AN *IN VIVO* PRUSSIAN BLUE TECHNIQUE.

(E.) Western, J.R.H. (Dept. Zool., U. Leeds, England) and J. B. Jennings. *Comp Biochem Physiol* 35(4):879-884, 1970.

A mixture of potassium ferrocyanide and ferric ammonium citrate (Prussian blue reaction) was incorporated into a semisolid meal and introduced into the stomachs of the *Cottus gobio*, *Enophrys bubalis*, and *Salmo trutta* through polyethylene tubes as a histochemical technique for the *in vivo* demonstration of gastric hydrochloric acid secretion in teleosts. One hr after administration of the test meal, a precipitate of Prussian blue appeared in some of the gastric glands, and the number of glands containing precipitate and the quantity of precipitate increased with time (the anterior esophagus, which has no gastric glands, showed no blue coloration). Between 24 and 36 hr after feeding, small amounts of precipitate were evident in the pyloric region of the stomach, the intestine, and the rectum, but since these quantities did not increase with time, the precipitate must have originated solely in the gastric glands and was being passively transported along the gut. Since intracellular precipitation of Prussian blue was not observed, although the precipitate was observed in the deepest portions of the gastric tubules, the acid responsible for the precipitate was produced only by these lining cells; both gastric hydrochloric acid and pepsinogen apparently are produced by the same cell in teleosts.

7778 A QUANTITATIVE DESCRIPTION OF THE INTESTINAL EPITHELIUM OF THE MOUSE. *(E.)*

Hagemann, R. F. (Allegheny Gen. Hosp., Pittsburgh, Pa.), C. P. Sigdestad and S. Lesher. *Amer J Anat* 129(1):41-51, 1970.

The use of combined cell kinetic, tritiated thymidine labeling and liquid scintillation counting techniques has permitted quantitation of several intestinal epithelial cell parameters in C57Bl/6 mice. Crypts/mg wet weight of intestine numbered 855 in the duodenum, 892 in the jejunum and 1164 in the ileum. Crypts were subdivided into proliferative cells and the following values were obtained: 1.6×10^5, 1.6×10^5 and 1.7×10^5/mg for duodenum, jejunum and ileum, resp., and for nonproliferative cells, 1.1×10^5, 1.1×10^5 and 1.2×10^5/mg, resp. A cell cycle analysis permitted the proliferative cells to be further subdivided, and the numbers of cells in each stage were determined. Division of the total number of proliferative cells by the mean cell generation time provided a value of 1.4×10^7 cells/hr for the cell production rate in the entire intestine; division of cell production rate/mg by crypt/mg gave values for cell production rate/crypt of 15.2 cells/crypt/hr, 14.6 and 11.2 for duodenum, jejunum and ileum, resp. Epithelial cells per jejunal villus numbered 3025, and there were 3.1×10^5 villous epithelial cells/mg jejunum. Values of 102 villi/mg and 8.7 crypts/villus were calculated for the jejunum.

7779 DETERMINATION OF BILIRUBIN UDP-GLUCURONYL TRANSFERASE ACTIVITY IN NEEDLE-BIOPSY SPECIMENS OF HUMAN LIVER. *(E.)*

Black, M. (Roy. Free Hosp., London, England), B. H. Billing and K. P. M. Heirwegh. *Clin Chim Acta* 29(1):27-35, 1970.

Bilirubin UDP-glucuronyl transferase activity and properties were determined in needle-biopsy specimens of human liver. Hepatic bilirubin UDP-glucuronyl transferase activities in rats and in patients with normal livers were comparable (mean: 1.5 and 1.0 mg/g liver/hr, resp.). The amount of bilirubin conjugated in periods of incubation ranging from 10-60 min followed first-order kinetics for up to 40 min and was linear with increased enzyme concentration. The optimal substrate concentration (UDP-glucuronic acid) was 1.67 μmoles in the presence of 5 mM Mg^{+2}. The optimum pH of 7.4 for human tissue differed from that of rat tissue which was nearer 7.7. A 4-fold increase in enzyme activity was seen with the addition of 1-2% digitonin. Chromatograms of the reaction products were compared with those prepared from diazotized human bile, and the development of azopigment G, which is the dominant glucuronide pigment in human bile, was confirmed.

7780 THE DEVELOPMENT OF THE DORSAL AND VENTRAL MAMMALIAN PANCREAS *IN VIVO* AND *IN VITRO*.

(E.) Spooner, B. S. (Dept. Biol. Sci., Stanford U., Calif.), B. T. Walther and W. J. Rutter. *J Cell Biol* 47(1):235-246, 1970.

The origin, morphogenesis and biochemical differentiation of the dorsal and ventral pancreas of the developing rat embryo were studied in organ cultures from trypsin-isolated whole gut endoderm. The ventral pancreatic diverticulum first appeared at 30 somite stage at the beginning of the 12th day of gestation while the dorsal diverticulum appeared midway through the 11th day of gestation in the 22-25 somite stage. Both pancreatic diverticula originated from the endoderm just posterior to the presumptive stomach, one appearing on the dorsal surface and the other on the ventral surface (the observations were confirmed in culture from whole guts taken from 11-day embryos). Initially, the ventral pancreas was smaller and began lobulation 12-24 hr later than the dorsal pancreas. Fusion between lobes began on day 16 *in vivo* and was fairly extensive by day 18 (fusion did not occur *in vitro*). When whole guts from embryos as young as 12 somites were grown in organ culture, both dorsal and ventral pancreas developed and eventually acquired levels of amylase corresponding to the differentiated state. *In vivo* analyses of the developmental profiles of carboxypeptidases A and B, amylase, chymotrypsin, ribonuclease and insulin revealed identical accumulation curves for the dorsal and ventral pancreas, but the glucagon-specific activity in the dorsal pancreas was five-to six-fold higher than that in the ventral pancreas.

7781 THE MOLECULAR SPECIES OF RAT LIVER PHOSPHATIDYLINOSITOL.

(E.) Akino, T. (Sapporo Med. Coll., Japan), H. Kanoh and T. Shimojo. *Tohoku J Exp Med* 101(3):289-297, 1970.

Phosphatidylinositol isolated from rat liver by DEAE-cellulose column and thin layer chromatography was fractionated into its molecular species (with different degrees of fatty acid unsaturation) before and after acetolysis. Both methods of fractionation yielded similar results: the tetraenoic species (stearoyl-arachidonyl type) was quantitatively dominant (86.8 to 89.7% of total phosphatidylinositol) and the dienoic species (stearoyl-linoleoyl type) was a minor component (8.0 to 9.6%). *In vivo* (1 mC ^{3}H-glycerol i.p.) and *in vitro* 10 μC ^{14}C-glycerol and 1 mC ^{32}P) incorporation studies revealed that the glycerol and phosphate moieties of phosphatidylinositol have the same metabolic behavior and although the tetraenoic species was present in such large amounts, it showed the least metabolic reactivity.

7782 SUBFRACTIONATION OF SMOOTH MICROSOMES FROM RAT LIVER.

(E.) Glaumann, H. (Karolinska Inst., Stockholm, Sweden) and G. Dallner. *J Cell Biol* 47(1):34-48, 1970.

Total smooth microsomes from rat liver isolated on a Cs$^+$-containing sucrose gradient were concentrated and subsequently fractionated by zone centrifugation on a stabilizing sucrose gradient. The median equilibrium density of the various smooth microsomal vesicles ranged from 1.10 to 1.18. The phospholipid/protein ratio was identical in all subfractions, but cholesterol, on a phospholipid basis, was enriched in the subfractions with the highest sedimentation velocity. The enzyme distribution pattern revealed a pronounced heterogeneity; a number of NADH- and NADPH-oxidizing enzymes were concentrated in the upper part of the gradient and exhibited a certain degree of separation from G-6-Pase; Mg^{++} ATPase and AMPase were enriched in the lower part of the gradient. No specific enrichment of newly synthesized NADPH-cytochrome *c* reductase activity occurred in any of the subfractions after phenobarbital treatment. Smooth microsomes, by adequate fractionation procedure, can be separated into subfractions of heterogeneous composition.

7783 PARTIAL PURIFICATION AND KINETICS OF ESTRIOL 16α-GLUCURONYLTRANFERASE FROM THE CYTOSOL FRACTION OF HUMAN LIVER.

(E.) Rao, G. S. (Inst. Clin. Biochem., U. Bonn, Germany), M. L. Rao and H. Breuer. *Biochem J* 118(4):625-634, 1970.

An enzyme (estriol 16α-glucuronyltransferase) that conjugates the 16α-hydroxy group of estriol with glucuronic acid was purified 100-fold from human liver by 0-30% saturation of the cytosolic fraction with ammonium sulfate followed by filtration of the precipitate through Sephadex G-200. The product of the reaction, estriol 16α-monoglucuronide, was identified by paper chromatography and by crystallization of the radioactive product to constant specific radioactivity. The optimum reaction temperature was 37°C, and the activation energy was calculated to be 11.1 kcal/mole; the apparent Michaelis-Menten constants for estriol and UDP-glucuronic acid were 13.3 and 100 μM, resp. Cu^{2+}, Zn^{2+} and Hg^{2+} inhibited, whereas Mg^{2+}, Mn^{2+} and Fe^{2+} stimulated the enzyme. Substrate-specificity studies indicated that the amount of estradiol-17β, estradiol-17α and estrone conjugated was not more than about 5% of that found for estriol. Estriol 16α-monoglucuronide, a product of the reaction, did not inhibit the 16α-estriol glucuronyltransferase, whereas UDP, another product of the reaction, inhibited the enzyme competitively with respect to UDP-glucuronic acid as the substrate and non-competitively with respect to estriol as the substrate. 17-Epiestriol acted as a competitive inhibitor and 16-epiestriol and 5α-pregnane-3α-diol as non-competitive inhibitors of the glucuronidation of estriol.

7784 ELECTRON MICROSCOPIC OBSERVATIONS ON THE LARGE SUBUNIT OF THE RAT LIVER RIBOSOME. *(E.)* Haga, J.Y. (Sloan-Kettering Inst. Cancer Res., New York, N.Y.), M.G. Hamilton and M.L. Petermann. *J Cell Biol* 47(1):211-221, 1970.

Active large subunits (59S) obtained by urea treatment of rat liver ribosomes were compared (uranyl-oxalate negative stain or shadow cast electron microscopy) with large subunits in intact ribosomes and with the subunits (50S) obtained by EDTA treatment. The negatively stained 59S subunits had a slightly ovoidal form; their average dimensions, 244 ± 17 X 207 ± 18 Å, were very close to the dimensions of the large subunits in intact ribosomes, and lay between the theoretical dimensions for anhydrous and fully hydrated particles that were calculated from the physical properties of the subunits in solution. The shadowcast preparations showed particles of similar shape. The 50S subunits, which had lost their 5S RNA, were shadow-cast at the same time and they appeared to be more spread out than the 59S subunits and had threadlike extensions. In the positively stained regions of uranyl oxalate-stained preparations the 50S particles varied greatly in shape and size, with average dimensions of 330 ± 21 X 276 ± 33 Å, and showed thread-like extensions like those of the shadow-cast particles. The frictional drag of these extensions probably accounts for the low sedimentation coefficient of 50S particles in solution.

7785 BIOCHEMICAL CHARACTERIZATION OF GASTROFERRIN. *(E.)* Saltman, P. (Dept. Biochem., U. California, San Diego), J.S. Multani, C.P. Cepurneek and P.S. Davis. *Biochemistry* 9(20):3970-3976, 1970.

Gastroferrin, a glycoprotein of human gastric juice, has been purified from human gastric juice and physically and chemically characterized. Gastroferrin migrated as a single peak in the analytical ultracentrifuge, but it was fractionated using DEAE-cellulose chromatography into several macromolecular species which appeared to differ only in their sialic acid content. Gastroferrin bound up to 6% its weight of iron, and removal of sialic acid did not affect its iron binding capacity. The polypeptide portion of the glycoprotein, 15% by weight of the molecule, was rich in threonine, proline, and serine. The remaining 85% of the molecule was mostly carbohydrate and consisted of galactose, fucose and the acetyl derivatives of sialic acid, glucosamine, and galactosamine. Analytical ultracentrifugation gave a molecular weight of 2.63 X 10^5 and a sedimentation constant of 8.9 S; osmometry yielded a slightly lower value of 2.35 X 10^5 for the average molecular weight, indicating a small degree of microheterogeneity. Viscosity measurements demonstrated that gastroferrin was very asymmetric with an intrinsic viscosity of 0.39 dl/g, and a frictional ratio of 2.2. Combination of viscosity data and sedimentation constant provided another independent estimate of the molecular weight of 2.78 X 10^5.

7786 SYNAPSES IN THE RAT STOMACH AND SMALL INTESTINE. *(E.)* Gabella, G. (Dept. Anat, U. Turin, Italy). *Experientia* 26(6):619-620, 1970.

The distribution and relative frequency of synapses of the myenteric plexus in the rat glandular stomach and penultimate loop of the small intestine were studied by electron microscopy in tissue samples treated with glutaraldehyde and osmium tetroxide and stained with uranyl acetate and lead citrate. Both axo-somatic and axo-dendritic synapses were observed in the myenteric plexus of the rat stomach and small intestine. The relative number of typical (or conventional) synapses in the stomach was 6 times higher than in the small intestine, suggesting that other interneuronal connections not morphologically detectable at present or other transmitter mechanisms may exist.

7787 INTRANUCLEOLAR DENSE PARTICLES IN RAT HEPATIC CELL NUCLEOLI. *(E.)* Shinozuka, H. (U. Pittsburgh Sch. Med., Pa.). *J Ultrastruct Res* 32(5-6):430-442, 1970.

Dense particles in the hepatic cell nucleoli of normal rats were observed when the tissue was fixed in *s*-collidine buffered osmium tetroxide. The particles ranging 70-300 Å in size appeared in clusters of varying numbers and were embedded in the confined areas of amorphous matrix adjacent to the fibrillar component of nucleolonema. When tissue was fixed in phosphate-buffered osmium tetroxide or *s*-collidine-buffered glutaraldehyde the appearance of these particles was not uniform. However, the nucleoli showed distinct spherical areas of amorphous matrix which appeared to correspond to the areas of particle deposition in *s*-collidine-buffered osmium-fixed tissue. Dense particles of an identical nature were also found in the simplified forms of the nucleoli which were seen during the phase of adenine-induced or spontaneous recovery after ethionine injury; the identification of these particles was much easier in these latter nucleoli than in controls because of the simplicity of their configuration. Particles and areas of particle depositio appear to be distinct components of the nucleoli of rat hepatic cells, though the chemical nature and the functional significance of these particles remains unclear.

7788 POLYRIBOSOMAL DISAGGREGATION INDUCED BY PUROMYCIN AND ITS REVERSAL WITH TIME: AN ULTRASTRUCTURAL STUDY OF MOUSE LIVER. *(E.)* Reid, I. M. (U. Pittsburgh Sch. Med., Pa.), H. Shinozuka and H. Sidransky. *Lab Invest* 23(1):119-127, 1970.

The effect of puromycin on mouse (CF1) liver ultrastructure, particularly polyribosomal configuration, and the recovery with time from the altered polyribosomal configuration were investigated by electr microscopy. At 20 or 30 min after a puromycin (0.2 mg., i.p.) injection to fasted mice, disaggregation of polyribosomes, fragmentation and degranulation of rough endoplasmic reticulum, accumulation of numerous liposomes, and reduction in number of

Golgi secretory vacuoles were observed. Restitution of polyribosomal configuration was evident at 90 and 80 min after a single injection; however, the recovery of other cytoplasmic changes was less prominent. Multiple (3 or 5) doses of puromycin at 30 min intervals exacerbated the changes; however, no cell necrosis was seen up to 150 min. There was considerable loss of glycogen, accumulation of liposomes and lipid droplets, and disruption of rough endoplasmic reticulum with some polyribosomal disaggregation in control mice fasted overnight, in comparison to nonfasted mice. The ultrastructural changes observed in puromycin-treated mice, particularly polyribosomal disaggregation, liposome formation, and reduction in number of Golgi vacuoles, correlate well with previously reported chemical findings consisting of protein synthesis inhibition, lipid accumulation, and defective secretion of lipoproteins.

7789 NUCLEAR MEMBRANES FROM MAMMALIAN LIVER: II. LIPID COMPOSITION. *(E.)* Kleinig, H. (2nd Inst. Biol., U. Freiburg, Germany). *J Cell Biol* 46(2):396-402, 1970.

The qualitative and quantitative lipid composition of nuclei and nuclear membranes from pig and rat liver were determined and compared with the corresponding data obtained for microsomes after similar treatment (citrate method). Only traces of lysolecithin were found, and other lysoderivatives and cardiolipin were not detected. The major part of the nuclear lipids was located in the membranes of the nuclear envelope. The phospholipid pattern of the nuclear membranes and the endoplasmic reticulum membranes in general was widely identical in both species. A striking difference in the lipid composition, a 4-fold increase of esterified cholesterol in the nuclear membranes, was found. In a quantitative approach the ratio of total surface area of the nuclear lipids to the total surface area of the nuclear envelope membranes was calculated as being 3.6, a value which approximates the requirements of a bimolecular lipid leaflet model.

7790 FERRIC CITRATE ACTION ON THE EXOCRINE PANCREAS OF THE GOLDEN HAMSTER: ELECTRON MICROSCOPIC STUDIES. *(Ger.)* Putzke, H. P. (Path. Inst. U. Rostock, Germany) and A. Bienengraber. *Exp Path* 4(4):265-276, 1970.

Ferric citrate (5-20 mg in 0.5, 1.0 and 1.5% solutions) was injected i.p. into 30 hamsters (at 3 days intervals for 8-29 days) in order to study the pathogenesis of pancreatic lipomatosis. The pancreas appeared smaller after 5 administrations of 1.0 and 1.5% concentrations, but no effects were noticed from the 0.5% solutions. Light microscopy showed increasing degeneration of exocrine pancreas tissue with duration of treatment with irregular occurrence of small fatty tissue complexes in the inter- and intralobular spaces and gradual disappearance of acinar cells and canaliculi. Cytoplasmic acidophilia and formation of siderous granular lysosomal structures occurred at the peri- and supranuclear zone of the cytoplasm. Electron microscopy revealed mitochondrial alterations with occurrence of fine granular deposits in the matrix and swelling with partial or complete destruction of the cristae. Secretory granules disappeared almost completely from the altered cells, and multiple lysosomes with a fine granular dense substance surrounded by a single layer membrane were noticed mainly in the region of the Golgi apparatus. A primary metabolic disorder in the acinar epithelia appears to be associated with ferric citrate administration with subsequent cytolysis and acinolysis; the mitochondria seem to be the main site of ferric citrate action.

7791 AN ELECTRON MICROSCOPIC STUDY OF THE FENESTRATED ENDOTHELIAL LINING OF RAT LIVER SINUSOIDS. *(E.)* Wisse, E. (Lab. Electron Microscopy, U. Leiden, Netherlands). *J Ultrastruct Res* 31(1-2):125-150, 1970.

The sinusoidal lining of rat liver was described from electron microscopic studies of specimens prepared by perfusion fixation, immersion fixation and freeze etching. Endothelial cell processes bearing interextending sieve plates composed most of the sinusoidal lining; the pore size of the fenestrations was measured to be 0.1 μ, and no larger openings occurred in the lining. Rat liver sinusoids can therefore be regarded as fenestrated capillaries differing from other fenestrated capillaries by the absence of a diaphragm within the fenestrations and the absence of a basement membrane surrounding the capillary; a highly selective filtering effect can be expected in the lining *in vivo*, especially with regard to the passage of particulate material of varying size, for instance chylomicrons. The connection of the fenestrated lining to a certain type of cell present in the sinusoidal lining can be used to identify this cell as an endothelial cell as compared to a Kupffer cell.

7792 THE FINE STRUCTURAL LOCALIZATION OF ENDOGENOUS AND EXOGENOUS PEROXIDASE ACTIVITY IN KUPFFER CELLS OF RAT LIVER. *(E.)* Fahimi, H. D. (Boston City Hosp., Mass.). *J Cell Biol* 47(1): 247-262, 1970.

Endogenous peroxidase activity has been demonstrated in sections of rat liver fixed briefly by glutaraldehyde perfusion and incubated in Graham and Karnovsky's medium for cytochemical demonstration of peroxidase activity. In 24-40% of sinusoidal cells, an electron-opaque reaction product was localized in segments of the endoplasmic reticulum, including the perinuclear cisternae, a few Golgi vesicles and saccules and in some large membrane-bounded granules. This staining was abolished after prolonged fixation or boiling of tissue sections in glutaraldehyde, and in the absence of H_2O_2 or 3,3'-diaminobenzidine from the incubation medium. The reaction was inhibited completely by sodium azide (1mM) and high concentrations of H_2O_2 and partially by KCN (2%), and aminotriazole (0.1 M). Among the different cells in hepatic sinusoids, the nonphagocytic "fat-storing" cells were always peroxidase negative, whereas the lining cells in process of erythrophagocytosis were consistently peroxidase positive. Exogenous horseradish peroxidase, which in contrast to endogenous peroxidase of Kupffer cells was not inhibited by prolonged aldehyde fixation, was taken up by micropinocytosis and remained confined to the lysosomal system of Kupffer cells. The possible biological significance of endogenous peroxidase in Kupffer cells remains obscure.

7793 LIGHT AND ELECTRON MICROSCOPE OBSERVATIONS ON AUTO- AND HETEROPHAGY IN THE EXOCRINE PANCREAS OF THE HIBERNATING FROG *(RANA ESCULENTA)*.

(E.) Geuze, J. J. (Ctr. Med. Electronmicroscopy, St. U. Utrecht, Netherlands). *J Ultrastruct Res* 32(5-6):391-404, 1970.

Auto- and heterophagy in the exocrine pancreas of the hibernating frog were investigated by light and electron microscopy. In the course of hibernation the frog pancreas was subject to a progressive infiltration of eosinophils and macrophages, a decrease in the number of zymogen granules per nucleus, a decrease in the size of the granules and cell volume and an increase of concentrated mitochondria near the small Golgi area. Relatively small vacuoles with an empty appearance were found near the Golgi area and larger ones (up to 5 μ in diameter) at greater distances. The acini of hibernating frog pancreas were composed of light cells which were characterized by a sparse vesicular rough endoplasmic reticulum and small Golgi system with few vesicles and short cisternae, dark cells which made up the majority of acinar cells and contained a denser cytoplasmic matrix, abundant lamellar or saccular endoplasmic reticulum and relatively few free ribosomes. A so-called mixed exocrine-endocrine cell type was situated in the vicinity of islets of Langerhans. Numerous residual bodies (dense bodies, cytosegresomes, cytosomes and autophagic vacuoles) present during hibernation showed that considerable lysis occurred in the acinar cells. Many zymogen granules incorporated into cytosegresomes were removed from the cells by heterophagic activity of macrophages and centroacinar cells. Endoplasmic reticulum, mitochondria, and nuclei were sequestered, and the endoplasmic reticulum was abolished by autophagic vacuoles abundant in the acinar cells during hibernation.

7794 FORMATION OF CELL COAT MATERIAL FOR THE WHOLE SURFACE OF COLUMNAR CELLS IN THE RAT SMALL INTESTINE, AS VISUALIZED BY RADIOAUTOGRAPHY WITH 1-FUCOSE-^{3}H.

(E.) Bennett, G. (Dept. Anat., McGill U., Montreal, Quebec, Canada) and C. P. Leblond. *J Cell Biol* 46(2):409-416, 1970.

The ultrastructure of rat duodenal columnar cells was investigated by radioautography with fucose-^{3}H (which is quite stable and is not transformed into glycogen or amino acids). At 2.5 and 5 min after fucose-^{3}H injection (5.0 mC/animal; specific activity 4.3 mC/mmole), the light microscope showed strong reaction over the supranuclear Golgi region in columnar cells of duodenal villi. The intensity of the reaction was maximal in the cells of the lower third of the villi and gradually decreased toward the apex. With the electron microscope, silver grains (Ilford L4 emulsion) were concentrated over the Golgi apparatus, whereas few silver grains were seen over the remainder of the cell, or over the apical, lateral, and basal surface membranes. By 20 min after injection, the silver grains were seen over the microvillar border, over the lateral surface membranes, and finally, over the basal surface membrane of the cell. By 4 hr after injection, the number of silver grains over the Golgi apparatus had greatly decreased, while they remained prominent over the apical and other surfaces. Apparently in rat duodenal columnar cells, and perhaps in some other cells, glycoprotein material is synthesized in the Golgi apparatus and transported to all cell surfaces to become part of the cell coat.

7795 SOME MORPHOLOGICAL AND BIOCHEMICAL CHARACTERISTICS OF ISOLATED RAT LIVER CELLS DISSOCIATED WITH SODIUM TETRAPHENYLBORON AND CULTURED IN SUSPENSION.

(E.) Casanello, D. E. (Lab. Nucl. Med. Radiat Biol., U. California, Los Angeles) and L. E. Gerschenson. *Exp Cell Res* 59(2): 283-290, 1970.

Some morphological and biochemical characteristics of isolated rat liver cells dissociated with sodium tetraphenylboron and cultured in suspension were investigated. After 30 days in culture, the shape of the hepatocytes was more irregular, the cytoplasmic vacuoles decreasing and the cytoplasm becoming more basophilic; the nucleus-cytoplasm size relation was the same as in the zero time cells. The production of $^{14}CO_2$ from glucose by cells pooled in Krebs-Ringer-Phosphate was very poor, but improved markedly if they were maintained in a medium supplemented with serine for 18 hr. Cells incubated in the serine-supplemented medium for 18 hr incorporated ^{14}C-U-leucine linearly at least for 3 hr, and this incorporation was inhibited by the addition of 0.5 mM puromycin. The integrity of the organ specific function of these cultured cells was established by the induction of tyrosine-α-ketoglutarate transaminase by treatment with 0.05 mM dexamethasone (control activity, 1.8 nmole/min/mg; dexamethasone-treated, 16.7 nmole/min/mg).

7796 HISTIDINE DECARBOXYLASE IN GASTRIC TISSUES OF PRIMATES.

(E.) Noll, W. E. (Yale U. Sch. Med., New Haven, Conn.) and R. J. Levine. *Biochem Pharmacol* 19(3):1043-1053, 1970.

Histidine decarboxylase activity was identified in the gastric mucosa of monkeys and man and in a human gastric carcinoid tumor. Crude homogenates of gastric mucosal tissue but not of the carcinoid tumor also demonstrated 5-hydroxytryptophan decarboxylase activity; this activity disappeared completely during purification procedures that resulted in increased specific activity of histidine decarboxylase. These histidine decarboxylases had properties that were very similar to or identical with histidine decarboxylases prepared from other mammalian sources: the apparent K_m varied inversely with pH (0.3 mM at pH 6.3); the pH optimum varied inversely with substrate concentration (optimal pH of 6.3 at 2.5 mM histidine); activity of the enzyme was enhanced by pyridoxal 5'-phosphate but not by benzene and inhibited by both bromcresine and hydrazino analog of histidine but not by α-methyl-dopa. In both monkeys and men histidine decarboxylase activity was greater in the fundus than in the antrum of the stomach. The enzyme necessary for histamine biosynthesis is present in gastric tissues of primates, supporting the hypothesis that histamine may mediate gastric acid secretion in primates.

7797 AN INTERPRETATION OF LIVER CELL MEMBRANE AND JUNCTION STRUCTURE BASED ON OBSERVATION OF FREEZE FRACTURE REPLICAS OF BOTH SIDES OF THE FRACTURE. *(E.)* Chalcroft, J. P. (Dept. Cell Biol., U. Auckland, New Zealand) and S. Bullivant. *J Cell Biol* 47(1):49-60, 1970.

A modification of the freeze-fracturing technique to permit observation of replicas of both sides of the fracture was used to study mouse liver cell membrane structure. Membranes broke to give two faces with three-dimensional complementarity (although there was some small-scale mismatching) and since the two distinctive sets of membrane faces were complementary sets, they could not be the two outside surfaces. Structures (such as particles) seen on these faces were within the membrane. The fracture plane with respect to a plasma membrane appeared to be close to the interface between membrane and cytoplasm, or at the interface. Models, consistent with the appearance of the matching replicas, were derived for three regions of the plasma membrane: (a) The nonjunctional plasma membrane, which contains many scattered particles (except for these particles, the otherwise flat fracture face is not at variance with a bimolecular leaflet structure). (b) Gap junctions consisting of the two membranes containing a close-packed array of particles. (c) Tight junctions consisting of membranes with internal ridges.

7798 ISOLATION OF A GOLGI-RICH FRACTION FROM RAT LIVER. *(E.)* Leelavathi, D. E. (U. Pittsburgh Sch. Med., Pa.), L. W. Estes, D. S. Feingold and B. Lombardi. *Biochim Biophys Acta* 211(2):124-138, 1970.

A fraction rich in membranes of the Golgi apparatus was isolated from rat liver by discontinuous density gradient centrifugation. Electron microscopic analysis of the fraction revealed the presence of structures very similar to those of the Golgi apparatus in intact cells, namely stacked cisternae, secretory vesicles, and tubular elements. The Golgi-rich fraction contained over 90% of the N-acetyllactosamine synthetase, about 2% of the glucose-6-phosphatase and 12% of the AMP phosphohydrolase present in the post-nuclear supernatant of liver homogenates. The protein and RNA content of the Golgi fraction were 2.9 mg/g liver and 0.1 mg/g liver, resp., but no attempt at estimating the degree of RNA contamination was made. Less than 0.5% of the post nuclear supernatant succinate-cytochrome *c* reductase activity was found in the Golgi fraction.

7825 ACTIVE SUGAR ACCUMULATION BY ISOLATED INTESTINAL EPITHELIAL CELLS: A NEW MODEL FOR SODIUM-DEPENDENT METABOLITE TRANSPORT. *(E.)*

Kimmich, G. A. (U. Rochester Sch. Med. Dent., N. Y.). *Biochemistry* 9(19):3669-3677, 1970.

Active sugar transport and the sodium gradient transport hypothesis were examined in a preparation of isolated intestinal epithelial cells. The isolated cells accumulated sugars by a sodium-dependent process which was inhibited severely by ouabain (0.5 mM) or oligomycin (10 μg/ml). Cells loaded with 50 mM intracellular Na^+ were able to actively accumulate sugar within a 1-2 min interval when placed in a medium containing 20 mM Na^+; the intracellular sodium concentration was greater than 20 mM during the entire 2 min interval, and the increment in sugar uptake was as great during the first 2 min as at any subsequent 2 min interval. Finally, cells loaded with 50 mM Na^+ and 2.5 mM 3-0-methylglucose accumulated additional sugar immediately when placed in media with 20 mM Na^+ and 1.25 mM 3-0-methylglucose, and no extrusion of sugar from the cell was observed in this case. A transport model based on the premise that energy for a number of energy-dependent processes may be derived from a common intermediate which is generated by the $[Na^+ + K^+]$-activated ATPase appeared to be more consistent with the experimental observations than the sodium gradient hypothesis.

7826 BILIARY EXCRETION OF CONTRAST MEDIA. *(E.)*

Rosati, G. (Bracco Chem. Co., Milan, Italy) and P. Schiantarelli. *Invest Radiol* 5(4):232-243, 1970.

The biliary excretion, urinary excretion, and plasma protein binding of iodipamide, ioglycamic acid and B 9720 were investigated in mongrel dogs. All these compounds were excreted by the liver through completely saturable processes, although there were some remarkable differences in the maximum transport velocity between the compounds examined; the maximum mean values for ioglycamic acid, iodipamide and B 9720 were 0.72, 0.48 and 0.34 μmole/kg/min, resp. Ioglycamic acids produced lower iodine concentrations (15 mg/ml) and a greater flow of bile (0.46 ml/30 min) than iodipamide (24 mg/ml; 0.38 ml/30 min) and B 9720 (27 mg/ml; 0.30 ml/ 30 min). For blood levels of less than 0.06 μmole/ml of blood, the biliary clearance of B 9720 was about 5 ml/kg, and the urinary clearance about 1 ml/kg; with increasing blood levels, the biliary clearance dropped rapidly to about 1 ml/kg and then slowly below this value, while the urinary clearance rose gradually until it reached a peak of 1.7 ml/kg. Iodipamide and ioglycamic acid presented a threshold level (0.06 and 0.16 μmole/ml) below which the excretion of both compounds was negligible through both the liver and the kidney. But as soon as the threshold value was exceeded, the biliary clearance rose rapidly until it settled between 1.4 and 1.3 ml/kg over a wide range of blood levels; the urinary clearance increased more gradually for both compounds and reached a peak at 1.0 and 1.4 ml/kg. In rats, the amounts of product excreted in 3 hr as a function of dose did not reveal any saturation of the liver capacity for excretion. Iodipamide and ioglycamic acid were bound by a group of numerous weak binding sites and a single strong binding site; B 9720 was weakly bound by a group of several binding sites.

7827 TRANSPORT STUDIES, MORPHOLOGICAL, HISTOCHEMICAL AND MORPHOMETRIC FINDINGS ON THE EXCLUDED SMALL INTESTINAL LOOP IN THE RAT. *(Ger.)*

Menge, H. (Med. U. Clin. Marburg, Germany), R. Bloch, E. Schaumloffel and E. O. Riecken. *Z Ges Exp Med* 153(1):74-90, 1970.

Histological and functional studies were performed using blind jejunal loops of the non-filling, self-emptying type in 29 female rats, two months postoperatively. Absorption of glucose decreased from 2.7 to 1.4 mg/cm/hr, and absorption of L-tryptophan-^3H was decreased from 33 to 23%; no changes in D-xylose-^{14}C absorption were noted. The mucosa was highly atrophic with reduction in the height of the villi, the thickness of the mucosal layer, and the number of mitoses. The following enzyme reactions were histologically investigated in 10 rats: ATPase, leucineaminopeptidase, non-specific alkaline phosphatase, acid phosphatase, non-specific microsomal esterase, succinate dehydrogenase, NADH and NADPH oxidases, cytochrome oxidase and monoamine oxidase. Enzymatic activity was unchanged in 7 rats, and a slight general reduction in activity was noted in 3 animals which also showed the most pronounced mucosal atrophy. A close correlation was established between absorption of glucose and the height of the villi (r=0.83), but not between the absorption of L-tryptophan and the height of the villi (r=0.43). A normal food load appears to be important for the maintenance of both mucosal structure and function.

7828 ABSORPTION BY THE RAT OF NONVOLATILE OXIDATION PRODUCTS OF LABELED RANDOMIZED CORN OIL. *(E.)*

Perkins, E. G. (Dept. Food Sci., U. Illinois, Urbana), S. M. Vachha and F. A. Kummerow. *J Nutr* 100(7):725-731, 1970.

The extent of lymphatic absorption of the methyl esters prepared from the nonvolatile oxidation products of labeled heat-abused corn oil was determined in thoracic duct-cannulated adult male rats. Maximum absorption of esters did not occur until 24 to 48 hr after they had been fed, with only 10.2% of the radioactivity appearing in the lymph lipid within 24 hr compared to 85% of the radioactivity from U-^{14}C-labeled unheated corn oil. Selective absorption of the nonvolatile oxidation products was demonstrated by the changes in recovery of radioactivity in the lipid classes separated on thin layer plates over various time periods; the proportion of triglycerides gradually decreased (29.1% to 8.4%) as that of the polar lipids increased (4.0% to 10.7%). Only 31.2% of the methyl esters of the heat-abused oil was absorbed within 48 hr, and 18.7% was metabolized; 7.6% of the radioactivity was deposited in the carcass, 1% in the liver, 5.9% in the gastrointestinal tract, 4.5% was excreted in the urine and 62.8% in the feces. The liver lipids of animals fed the methyl esters of the heated oil contained fewer polar lipids (18.8%) and the carcass lipids contained less triglyceride (28.7%) than the animals fed unheated corn oil (39.4% and 74.1%, resp.). The free fatty acids of the nonvolatile oxidation products were more readily metabolized (25.0%) and dilution of the methyl esters with 55% unlabeled corn oil increased excreted fecal radioactivity while dilution with 90% unlabeled corn oil increased excreted radioactivity in the urine.

7829 THE EFFECT OF NEOMYCIN ON IRON ABSORPTION IN GERMFREE RATS. *(E.)* Geever, E. F. (Albert Einstein Coll. Med., Bronx, N.Y.), L. V. Crowley and S. M. Levenson. *Brit J Haemat* 18(5): 567-574, 1970.

Radioiron absorption studies were performed on two groups of adult male germfree and open animal room rats which were raised in germfree isolators and shielded from external bacterial exposure from weanling to adult life. Both groups were given a 5 day course of neomycin treatment (0.5 g/day) and 1 day later radioiron (0.23 µC in 0.25 mg) was administered by intragastric instillation. Both groups showed an increase in radioiron absorption and total serum iron level over controls at sacrifice 7 days following intragastric instillation (% absorbed: germfree controls 8.1%, neomycin-treated 12.7%; isolator-housed controls 5.9%; neomycin-treated 15.3%). These findings suggest that the neomycin effect on iron absorption is a complex one which may operate in the absence of living bacteria.

7830 THE RELEASE OF ^{45}Ca FROM MITOCHONDRIA OF CHICKEN INTESTINAL MUCOSA BY CALCIUM BINDING PROTEIN. *(E.)* Hamilton, J. W. (Biochemistry Dept. U. Tasmania, Hobart) and E. S. Holdsworth. *Biochem Biophys Res Commun* 40(6):1325-1330, 1970.

The release of Ca from mitochondria isolated from chicken intestinal mucosal cells preloaded *in vivo* with ^{45}Ca was isolated. The specific calcium binding protein prepared from vitamin D-replete chicks caused the release of Ca in a time-dependent and concentration-dependent (calcium binding protein) manner; similar extracts prepared from vitamin D deficient chicks had no effect on ^{45}Ca release. The effects of vitamin D on calcium translocation can be explained by the greater "turnover" of Ca in mitochondria when calcium binding protein is present.

7831 TRANSPORT OF 5-THIO-D-GLUCOSE IN HAMSTER SMALL INTESTINE. *(E.)* Critchley, D. R. (Rutgers Med. Sch., New Brunswick, N.J.), A. Eichholz and R. K. Crane. *Biochim Biophys Acta* 211(2):244-254, 1970.

Segments of hamster small intestine were used to study the interaction of 5-thio-D-glucose with the D-glucose transport system. Accumulation against concentration gradient, substrate inhibition, phlorizin sensitivity, Na$^+$ dependence, energy dependence and counterflow were determined; the estimated K_m value for 5-thio-D-glucose was of the order of 2.8 mM. Two interesting differences between D-glucose and 5-thio-D-glucose were found: 5-thio-D-glucose was less effective than D-glucose in inhibiting the specific binding of D-^{3}H-glucose to brush borders; 5-thio-D-glucose was also a poor substrate for hexokinase. The effect of the sulfur substitution for oxygen appears to have affected the reactivity of 5-thio-D-glucose only slightly with respect to binding and hexokinase interaction, while active transport of 5-thio-D-glucose appears to be unaffected by this molecular alteration.

7832 EFFECT OF COBALT ON IRON ABSORPTION. *(E.)* Schade, S. G. (Walter Reed Army Inst. Res., Washington, D. C.), B. F. Felsher, B. E. Glader and M. E. Conrad. *Proc Soc Exp Biol Med* 134(3):741-743, 1970.

The effect of cobalt (50 µmoles) upon the mucosal uptake of iron was investigated in rats by monitoring radioiron uptake. In animals receiving only iron, iron absorption increased in a biphasic manner with increasing doses of carrier iron. The first phase of absorption apparently represented absorption facilitated by a saturable carrier, whereas the second portion probably represented diffusion. The addition of cobalt to the test doses of iron produced a linear dose-related response similar to that seen in rats receiving high doses of iron alone. Significantly less radioactive iron was observed in both the carcass and small intestine of animals receiving 25 µmoles cobalt with test doses of radiation (0.27 µmole) as compared to animals receiving iron alone (0.69 µmole), indicating that cobalt diminished the mucosal uptake of the iron from the lumen of the gut. Cobalt was probably capable of saturating a common pathway in intestinal absorptive cells for the absorption of both metals.

7833 HYDROGEN AND SODIUM PERMEATION OF CANINE GASTRIC MUCOSA DURING HISTAMINE AND SODIUM THIOCYANATE ADMINISTRATION. *(E.)* Moody, F. G. (U. Alabama Med Ctr., Birmingham) and W. L. Davis. *Gastroenterology* 59(3):350-357, 1970.

The hydrogen-sodium diffusion barrier of canine gastric corpus epithelium was studied during rest, stimulation (in response to histamine 1 µg/kg/min), and inhibition (by thiocyanate 49 mEq for 1 hr followed by 0.2 mEq/min) of acid secretion. Isosmotic acid and mannitol solutions were instilled onto the mucosal surface of exteriorized, chambered gastric segments for this purpose. Stimulation led to an increased back diffusion of hydrogen and a decrease in sodium efflux; inhibition resulted in little further change. Thiocyanate administration, prior to stimulation, produced a 2-fold increase in hydrogen-sodium exchange. Subsequent histamine infusion further increased this exchange and led to gross disruption of the mucosal surface.

7834 STRUCTURAL REQUIREMENTS FOR ACTIVE INTESTINAL TRANSPORT: THE NATURE OF THE CARRIER-SUGAR BONDING AT C-2 AND THE RING OXYGEN OF THE SUGAR. *(E.)* Barnett, J. E. G. (Dept. Physiol., U. Southampton, England), A. Ralph and K. A. Munday. *Biochem J* 118(5):843-850, 1970.

Various sugars were incubated with slices of everted hamster intestinal tissue to determine structural requirements for transport by the Na^+-dependent sugar carrier. Sugars were assumed to be transported by this carrier if the accumulation was diminished in the absence of Na^+ and in the presence of the competitive inhibitor 1,5-anhydro-D-glucitol. The extent of accumulation was correlated with the number of hydroxyl groups in the D-gluco configuration if the ring oxygen was placed in the normal D-glucose position. 5-Thio-D-glucose, with a sulphur atom in the ring, was transported at about the same rate as D-glucose (final tissue/medium ratio of 8.2 and 5.1, resp.) and had a similar K_i for D-galactose transport (2.9 and 2.3 mM, resp.), but myoinositol was poorly accumulated (tissue/medium rate of 0.6). No sugar without a hydroxyl group in the D-gluco position at C-2 of the sugar, including D-mannose, 2-deoxy-D-glucose,2-chloro-2-deoxy-D-glucose and 2-deoxy-2-fluoro-D-glucose, was transported by the Na^+-dependent carrier, but these sugars and L-fucose weakly and competitively inhibited the accumulation of L-glucose into slices of everted hamster intestinal tissue. A possible mechanism for active intestinal transport may involve covalent carrier-sugar binding.

7835 IMPAIRED JEJUNAL ABSORPTION RATES OF ESSENTIAL AMINO ACIDS INDUCED BY EITHER DIETARY CALORIC OR PROTEIN DEPRIVATION IN MAN. *(E.)* Adibi, S. A. (Montefiore Hosp., Pittsburgh, Pa.) and E. R. Allen. *Gastroenterology* 59(3):404-413, 1970.

Changes in transport specificity and jejunal absorption rates of essential amino acids were investigated in 7 normal and 7 obese human volunteers after 2 weeks of total starvation or isocaloric protein-free dieting by an *in vivo* perfusion technique. Both starvation and protein depletion resulted in the reduction of amino acid absorption rates at higher perfusion concentrations (10-20 mM) in 12 subjects (control, 745; starved, 444 μmole/min/30 cm at 10 mM). However, the specificity of preferential amino acid absorption (methionine > leucine and isoleucine > valine > lysine > phenylalanine > tryptophan > threonine) from equimolar mixtures of all eight essential amino acids was not affected by these dietary manipulations. Moreover, there was a decrease in the absorption rates of amino acids with high (leucine) as well as low (threonine) affinity for the amino acid carrier systems. The evidence for a reduction in the capacity of the intestine to transport leucine after starvation was further supported by a lower rise in the plasma concentrations of leucine during the perfusion studies in starved subjects. In the face of reduced amino acid absorption rate, the jejunal mucosal histology and cell organelles appeared intact.

7836 STUDIES ON THE MECHANISM OF ACTION OF CALCIFEROL: III. VITAMIN D-MEDIATED INCREASE OF INTESTINAL BRUSH BORDER ALKALINE PHOSPHATASE ACTIVITY. *(E.)* Normal, A. W. (Dept. Biochem., U. California, Riverside), A. K. Mircheff, T. H. Adams and A. Spielvogel. *Biochim Biophys Acta* 215(2):348-359, 1970.

Some of the biochemical consequences of vitamin D administration, *in vivo*, in its target organ, the intestinal mucosa were investigated. Oral administration of 500 I.U. of vitamin D_3 (cholecalciferol) to vitamin D-deficient chicks caused the level of alkaline phosphatase (orthophosphoric monoester phosphohydrolase, EC 3.I.3.I.) of intestinal mucosal homogenates to increase maximally (2-3-fold) 60 hr after the administration of the vitamin. The intestinal alkaline phosphatase(s) of both vitamin D-deficient and vitamin D-treated chicks was localized exclusively in the brush border or microvilli fraction. The brush border levels of Ca^{2+}-stimulated ATPase (ATP phosphohydrolase, EC 3.6.I.3) were elevated after vitamin D administration; however, vitamin D treatment caused no change in the levels of invertase (β-D-fructofuranoside fructohydrolase, EC 3.2.I.26) and other related disaccharidases localized in the intestinal brush border fraction. The rise in intestinal brush border alkaline phosphatase mediated by vitamin D was prevented by the administration *in vivo* of cycloheximide, suggesting that the vitamin induced the *de novo* synthesis of this enzyme. The simultaneous time-course of appearance of increased levels of brush border alkaline phosphatase and the increased rate of transport of calcium, measured *in vitro* across intact segments of ileal tissue after oral vitamin D_3 administration, suggest a functional involvement of alkaline phosphatase in vitamin D-mediated calcium transport.

7837 EXCRETION OF NEUTRAL STEROID HORMONES IN HUMAN BILE. *(E.)* Laatikainen, T. (Dept. Med. Chem., U. Helsinki, Finland). *Ann Clin Res* 2(3):1-28, 1970.

MOTILITY

7852 EFFECT OF ALCOHOL ON GASTRIC EMPTYING IN MAN. *(E.)* Barboriak, J. J. (Marquette Sch. Med., Milwaukee, Wisc.) and R. C. Meade. *Amer J Clin Nutr* 23(9):1151-1153, 1970.

The effect of preprandial alcohol on gastric emptying was investigated in 8 healthy men with the use of ^{51}Cr chloride (300 μC) as the marker and external counting of radioactivity. After a balanced test meal containing about 60 g fat, an exponential decrease of radioactivity from the gastric area with an average half-time of 105 min was observed. Ingestion of 4 oz whiskey before the meal increased the emptying time by 99 min. Since animal studies have shown that pure alcohol is an effective inhibitor of gastric emptying, the congeners present in the whiskey were probably of minor importance.

7853 MORPHOLOGICAL AND AUTORADIOGRAPHIC INVESTIGATION OF ALTERATIONS IN THE SMALL INTESTINAL MUCOSA OF RATS WITH BLIND LOOPS. *(Ger.)* Lohrs, U. (Path. Inst. U. Cologne, Germany), B. Wiebecke and H. J. Castrup. *Virchows Arch Path Anat* 350(2):150-165, 1970.

Changes in the jejunal mucosa of rats produced by isoperistaltic, self-filling and blind or antiperistaltic, self-emptying pouches of 4 months duration were investigated histologically and radiographically after i.p. injection of tritiated thymidine. All blind pouches showed circumscribed areas of mucosal changes, chiefly in their terminal portion; self-filling pouches presented subtotal villous atrophy and hyperregenerative atrophy associated with increased regeneration in the deepened crypts, as evident from the histological findings and autoradiographs. Marked hypertrophy of the muscularis propria, and localized inflammatory reactions were also observed. The histochemical non-specific alkaline phosphate reaction was markedly diminished, or missing, in only those areas of blind pouches which showed marked histopathology. Self-emptying pouches showed similar but considerably less changes, and mucosal hypertrophy was noted in the rest of the small intestine.

7854 METABOLIC ACTIONS IN INTESTINAL SMOOTH MUSCLE ASSOCIATED WITH RELAXATION MEDIATED BY ADRENERGIC α- AND β-RECEPTORS. *(E.)* Andersson, R. (Sch. Med., Linkoping, Sweden) and E. Mohme-Lundholm. *Acta Physiol Scand* 79(2):244-261, 1970.

The metabolic responses associated with relaxation produced by selective stimulation of adrenergic α-receptors with phenylephrine and of β-receptors with isoprenaline were studied in rabbit colonic muscle. The α-receptor-induced relaxation was not accompanied initially by any metabolic effects but a latency period of 3 min decreased the phosphorylase *a* activity, the cyclic AMP content and the concentrations of hexose phosphates and lactate and increased the concentration of high-energy phosphate compounds (ATP and CrP). These effects were inhibited by dibenamine. The relaxation induced via adrenergic β-receptors was preceded by an increase in the cyclic AMP content and the phosphorylase *a* activity, an increase in the concentration of hexose phosphates and lactate and an initial decrease of the ATP and CrP concentrations, which after 10 min was succeeded by an increase. The magnitudes of the relaxing and metabolic responses following stimulation of β-receptors were correlated with regard to time and dose. These responses were blocked by an adrenergic β-receptor blocking agent (sotalol) and were also eliminated in carbohydrate-poor muscle. The relaxing and metabolic effects of isoprenaline could be reproduced completely by cyclic AMP, only incompletely by 5'AMP and not at all by other tested cyclic nucleotides.

SECRETION AND METABOLISM

Stomach

7859 THE ACTION OF CERULEIN ON GASTRIC SECRETION OF THE CHICKEN. *(E.)* Angelucci, L. (Inst. Med. Pharmacol., U. Rome, Italy) and G. Linari. *Europ J Pharmacol* 11(2):204-216, 1970.

The effect of cerulein (10-50 ng/kg i.v. or s.c.) was variable in stimulating gastric secretion of chickens. In general, cerulein increased slightly the output of the fluid and solid components of gastric juice and generally raised the concentration of pepsin 20-40%. Slight tachyphylaxis particularly on the fluid and acid components was observed; cerulein stimulation of gastric secretion was completely inhibited by atropine but unaffected by drugs altering histamine stores. Cerulein was 4 times as effective on fluid and acid secretion as human gastrin I, and 15 times as effective on pepsin secretion; porcine secretin did not affect the chicken's gastric secretion.

7860 GASTRIC ACID RESPONSE TO PENTAGASTRIN AND HISTAMINE AFTER EXTRAGASTRIC VAGOTOMY IN DOGS. *(E.)* Grossman, M. I. (VA Ctr., Los Angeles, Calif.) and G. F. Stening. *Gastroenterology* 59(3): 364-371, 1970.

The effect of extragastric vagotomy (cutting the hepatic and celiac branches) on the gastric acid response to pentagastrin (4-32 μg/kg/hr) and histamine (0.04-0.32 mg/kg/hr) was studied in dogs. An increase in the submaximal and maximal responses from vagally denervated stomach (main stomach with selective gastric vagotomy or Heidenhain pouch) was seen only with pentagastrin stimulation, not with histamine, and only in vagally denervated stomach, not in the main stomach with intact vagal innervation. This effect appears to be the result of withdrawal of an inhibitor of unknown source and nature that is released by the spontaneous activity of vagal efferent fibers.

7861 EFFECT OF CERULEIN ON HISTAMINE AND PENTAGASTRIN-INDUCED GASTRIC SECRETION IN MAN. *(E.)* Konturek, S. J. (Med. Acad. Cracow, Poland) and B. Gabrys. *Amer J Dig Dis* 15(9):791-795, 1970.

The effect of cerulein, a decapeptide isolated from frog skins, on basal and on histamine- or pentagastrin-stimulated gastric acid secretion was studied in 6 human subjects. This peptide, added in a dose of 0.1 μg/kg/hr to an i.v. infusion of pentagastrin (2.0 μg/kg/hr), produced approximately 50% inhibition of near maximal gastric acid secretion, but stimulated secretion slightly when given alone. However, it increased gastric acid response to histamine diphosphate infused i.v. in a dose of 40 μg/kg/hr. The hypothesis of hormonal interaction was applied to explain the inhibitory and stimulatory effect of cerulein on pentagastrin- and histamine-induced gastric acid secretion in man.

7862 GASTRIC AND PANCREATIC RESPONSES TO JEJUNAL DISTENTION: EFFECT OF EXTRACORPOREAL MESENTERIC VASCULAR PERFUSION. *(E.)* Chung, R. S. K. (Beth Israel Hosp., Boston, Mass.), D. Fromm, L. Trencis and W. Silen. *Gastroenterology* 59(3): 387-395, 1970.

The effects of jejunal distention on gastric and pancreatic secretion were studied in dogs with intact jejunal and ileal blood supply and in dogs with an isolated extracorporeal perfusion preparation of the jejunum and ileum. Distention of the proximal jejunum increased gastric secretion from the intact stomach and increased protein output in the pancreatic secretion of dogs given a constant infusion of secretin. When the blood supply of the jejunum and ileum were isolated and perfused extracorporeally (the autonomic nerves remaining intact as verified by electrical stimulation), distention of the jejunum produced no increase in gastric acid or pancreatic protein output. In 6 dogs the blood supply was successfully reconstituted, and distention of the jejunum again increased gastric acid or pancreatic protein output; ileal absorption of glucose against a concentration gradient remained unaltered throughout and histology of the bowel was normal. Long nervous reflex arcs apparently did not play a significant role in eliciting the gastric or pancreatic response when the small intestine was stimulated by distention, but effects were humoral and were compatible with those of gastrin or cholecystokinin-pancreozymin.

7863 EFFECTS OF ULCEROGENIC AND ANTIULCER DRUGS ON GASTRIC SECRETION IN RATS. *(E.)* Catanese, B. (Rome, Italy), R. Lisciani and B. Silvestrini. *Pharmacol Res Commun* 2(2):83-90, 1970.

The effects of benzydamine, reserpine, proxazole, banthine and indomethacin on gastric secretion in rats were investigated. Indomethacin (12.5 mg/kg s.c.) had no effect on secretion, but reserpine (5 mg/kg s.c.) increased production of HCl (control 298; treatment 416 mg HCl/100 ml gastric juice) and pepsin and decreased gastric juice and mucin slightly. Benzydamine (100 mg/kg p.o.) significantly decreased production of HCl (317 to 256 mg HCl/100 ml gastric juice) and increased mucin production (410 to 580 mg%). Proxazole (100 mg/kg p.o.) had no antisecretive action, while the mucin production was increased (468 to 609 mg%). Banthine (10 mg/kg s.c.) had a marked antisecretive action on all gastric juice components.

7864 THE PEPSINS FROM HUMAN GASTRIC MUCOSAL EXTRACTS. *(E.)* Etherington, D. J. (Agric. Res. Counc. Meat Res. Inst., Langford, Bristol, England) and W. H. Taylor. *Biochem J* 118(4):587-594, 1970.

Gastric mucosal pepsins and pepsinogens in stomach extracts of 2 normal subjects, 7 patients with gastric adenocarcinoma and 2 patients with duodenal ulcer were investigated by agar-gel electrophoresis and by ion-exchange chromatography. Of the 8 zones of proteolytic activity that have previously been reported in normal human gastric juice, 7 were detected in activated fundic mucosal extracts, 4 of which were attributed to discrete pepsins, numbered 1, 3a, 3 and 5. Zone 7 resulted from the activity of one or more alkali-stable enzymes referred to as gastric proteinases rather than as pepsins; zone 7 was more evident in mucosal extracts than in gastric juice. Zones 4 and 6 seemed to result from the activity of a pepsin-inhibitor complex and of an unactivated zymogen, resp. Pyloric mucosal extracts contained principally zone 5 but also zones 6 and 7; these zones behaved similarly to the corresponding zones of fundic extracts, but pyloric pepsin 5 migrated slightly faster on agar-gel electrophoresis than did fundic pepsin 5 and was a different enzyme (zones 1 to 4 were absent).

7865 EVIDENCE THAT HISTAMINE IS NOT THE MEDIATOR OF ACID SECRETION IN THE RAT. *(E.)* Johnson, L. R. (U. Oklahoma Med. Ctr., Oklahoma City) and D. Aures. *Proc Soc Exp Biol Med* 134(3):880-884, 1970.

In order to see whether or not histamine release takes place during the inhibition of acid secretion, 12 fasted rats were injected i.p. with either saline, pentagastrin (125 μg/kg) or pentagastrin plus secretin (75 units/kg) and killed 90 min later. Pentagastrin and the combination of pentagastrin and secretin released 50% of the histamine contained in the wall of the oxyntic gland area of the stomach. Therefore, secretin does not inhibit gastrin-stimulated secretion by inhibiting histamine release as has been hypothesized. Since this dose of secretin completely inhibits acid secretion stimulated by 125 μg/kg of pentagastrin in rats but has no effect on a comparable amount of histamine stimulated secretion, gastrin probably stimulates the parietal cell without the intervention of histamine.

7866 RESPONSE OF CANINE GASTRIC MUCOSA TO HISTAMINE FOLLOWING EXPERIMENTAL IMPAIRMENT OF THE GASTRIC MUCUS BARRIER. *(E.)* Kowalewski, K. (Surg. Med. Res. Inst., U. Alberta, Edmonton, Canada), J. F. Schier and A. Koheil. *Canad J Surg* 13(3):295-302, 1970.

Experimental impairment of the gastric mucus barrier was produced by introducing 2N NaCl into Heidenhain pouches for 2 hr and washing out large amounts of neutral glycoproteins. After maximal intra-arterial histamine stimulation for 6 hr, pouches deprived of their mucus barrier secreted gastric juice rich in mucosubstances and in protein; the mucosa of these pouches resembled acute hemorrhagic gastritis with edema, congestion, superficial submucosal and subserosal hemorrhagic spots, mucosal erosions and acute ulcers. Pouches washed with 0.15 N NaCl and stimulated with histamine for 6 hr secreted gastric juice with less mucosubstances and protein than the pouches washed with 2N NaCl and appeared macroscopically and histologically normal at the end of the experiment.

7867 THE EFFECT OF C-TERMINAL GASTRIN TETRAPEPTIDE AND ITS ANALOGUES ON THE GASTRIC FUNCTION IN CATS AND DOGS. *(Rus.)* Kimenis, A. A. (Inst. Organic Synthesis, Latvian SSR Acad. Sci., USSR) and Z. A. Atare. *Farmakol Toksik* 33(3):333-336, 1970.

SECRETION AND METABOLISM

Pancreas

7877 ACTION OF CERULEIN ON PANCREATIC SECRETION IN MAN. *(E.)* Agosti, A. (Dept. Pharmacol., U. Parma, Italy), S. Biasioli and G. Bertaccini. *Pharmacol Res Commun* 2(2):125-133, 1970.

The effect of cerulein on pancreatic secretion in 20 normal, male subjects (28-46 yr) was investigated. Cerulein given i.v. (0.10 μg/kg) caused an immediate but short-lasting (15 min) increase in duodenal juice volume (10 to 38 ml/15 min); i.m. cerulein (0.75 μg/kg) caused a more gradual but sustained volume increase (12 to 26 ml/15 min), which lasted more than 1 hr. An immediate sharp rise in amylase and trypsin concentration resulted from i.v. cerulein, but i.m. cerulein produced a lower peak effect in the second 15 min period after injection with greater decline in the last periods. Almost identical changes in concentrations of electrolytes were produced by i.v. or i.m. cerulein with Na$^+$ concentration increasing from 136 to 151 mEq/l, Cl$^-$ concentration decreasing from 115 to 99 mEq/l and HCO$_3^-$ concentration increasing from 10 to 27 mEq/l. In 3 subjects flush, mild tachycardia, sweating and nausea appeared a few min after 0.10 μg/kg cerulein i.v. and lasted approximately 10 min. Cerulein may offer some practical advantages over cholecystokinin-pancreozymin in testing of pancreatic function in man with or without simultaneous administration of secretin.

7878 THE ACTION OF CERULEIN ON PANCREATIC AND BILIARY SECRETIONS OF THE CHICKEN. *(E.)* Angelucci, L. (Inst. Med. Pharmacol., U. Rome, Italy M. Baldieri and G. Linari. *Europ J Pharmacol* 11(2): 217-232, 1970.

Cerulein strongly stimulated pancreatic secretion in chickens when administered by i.v. infusion (threshold rates of 0.1-0.25 ng/kg/min). S.c. injection proved ineffective up to 5 μg/kg; by rapid i.v. injection the action was manifest only with 50 ng/kg. Cerulein increased output of fluid, bicarbonate and enzymes, greatly enhancing the enzyme concentration; atropine inhibited the effect of cerulein on enzyme concentration only. Porcine secretin had no effect on the chicken's pancreatic secretion. Flow of hepatic bile and the output of solid biliary components were also stimulated by cerulein at threshold doses of 10 ng/kg by rapid i.v. injection, and 0.5 ng/kg/min by i.v. infusion; these actions were not inhibited by atropine. Cerulein hastened plasma clearance and biliary excretio of BSP, and it increased output of cystic bile by stimulating gall bladder motility. Tachyphylaxis to effects of cerulein on pancreatic or biliary secretions was not seen.

7879 PHARMACOLOGICAL STUDIES ON THE REGULATION OF PANCREATIC SECRETION IN PIGS. *(E.)*

Hong, S. S. (Dept. Pharmacol., Yonsei U., Seoul, Korea) and D. F. Magee. *Ann Surg* 172(1):41-48, 1970.

Gastric acid was diverted from the upper small intestine and a number of foodstuffs and HCl were introduced into the duodenum in pigs with pancreatic fistulas. The pattern of volume, amylase, lipase and protein secretion depended on the stimulus. Ethanol (20%) was a potent stimulant of amylase (900%). The application of a local anesthetic (oxethazine 2 mg/ml) to the duodenal mucosa reduced the usual increase in juice volume or enzymes following intraduodenal peptone, HCl and oleic acid. Atropine and pentolinium tartrate reduced the enzyme and volume responses to all intraduodenal stimuli, as well as to secretin and pancreozymin stimulation.

7880 ESTIMATION OF THE HALF LIFE OF CHOLECYSTOKININ. *(Ger.)*

Lehnert, P. (2nd Med. U. Clin., Munich), H. Stahlheber, M. M. Forell, F. H. Dost, H. Fritz, M. Hutzel and E. Werle. *Hoppe Seyler Z Physiol Chem* 351(8):983-989, 1970.

The $t_{1/2}$ of cholecystokinin-pancreozymin, which cannot be determined directly, was estimated by evaluation of the rate of enzyme secretion from cannulated pancreatic ducts of 10 anesthetized dogs. Comparing activity curves of trypsin, amylase and lipase with the i.v. (femoral) and intra-arterial (pancreaticoduodenal) injected dose, the $t_{1/2}$ of 1.8 min for cholecystokinin-pancreozymin was estimated from the slope of the obtained curves. The $t_{1/2}$ was not constant due to double logarithmic decrease in activity.

7881 STIMULATION OF PANCREATIC SECRETION BY INTRADUODENAL INFUSION OF BILE-SALTS. *(E.)*

Wormsley, K. G. (Mayfield Hosp., Dundee, Scotland). *Lancet* 2(7673):586-588, 1970.

The pancreatic secretory response to intraduodenal administration of bile salts was measured in 14 individuals with normal outputs of bicarbonate and of enzymes in response to i.v. secretin (0.25 U/kg/hr). After 40 min infusion of secretin, bile salts were introduced into the duodenum as a rapid injection (6 g in 20 ml) or as a continuous infusion (36 g/hr). The output of pancreatic enzymes increased to levels which were usually 75-80% of the response to i.v. infusion of secretin plus pancreozymin. Probably the mechanism of action of bile salts in stimulating the pancreas represents yet another mechanism for integrating functions of the pancreas, biliary tract and small intestine.

7882 SYNTHETIC AND SECRETORY EFFECTS OF CHOLECYSTOKININ-PANCREOZYMIN ON THE PIGEON PANCREAS. *(E.)*

SECRETION AND METABOLISM

Hepatobiliary Tract

7883 STUDIES ON THE REGULATION OF HEPATIC BILE FLOW: THE INTESTINAL PHASE OF BILIARY SECRETION. *(E.)*

Sum, P. T. (Harvard Med. Sch., Boston, Mass.), H. Ross, R. S. K. Chung, L. Trencis and W. Silen. *Amer J Surg* 120(2):160-165, 1970.

In order to elucidate the mechanism of hepatic bile flow stimulation through acidification of the proximal small intestine, 8 mongrel dogs were prepared with cholecystectomy, ligation of the minor pancreatic duct, gastric and duodenal cannulas, and Thiry-Vella fistulas of the distal duodenum and jejunum. Perfusion of the distal duodenum or jejunum with acid caused significant increases in biliary volume (from 2.4 to 3.5 ml/15 min and from 2.2 to 2.9 ml/15 min, resp.) and bicarbonate concentrations (from 22 to 40 mEq/l) as well as gastric acid output (from 0.1 to 1.7 and from 0.6 to 2.4 mEq/30 min, resp.). Acid perfusion of the jejunum also caused an increase in chloride concentration (from 59 to 68 mEq/l). Responses similar to those of jejunal perfusion were noted when cholecystokinin-pancreozymin, 2 U/kg/hr i.v. was given. Although the additional simultaneous infusion of secretin, 4 U/kg/hr, accentuated the changes in biliary volume and bicarbonate concentration, gastric acid output was reduced. Perfusion of the duodenum with a 5 per cent Bacto-Peptone solution caused no significant change in biliary flow. The physiologic effects of acid perfusion of the distal duodenum of jejunum are best explained by the simultaneous release of both secretin and cholecystokinin-pancreozymin.

7884 THE METHYLATION OF TRANSFER RIBONUCLEIC ACID DURING REGENERATION OF THE LIVER. *(E.)* Tidwell, T. (U. Texas M.D. Anderson Hosp. Tumor Inst., Houston). *J Cell Biol* 46(2):370-378, 1970.

The methylation of transfer RNA (tRNA) during regeneration (following 2/3 hepatectomy) of rat liver was investigated, and the time courses of methylation and synthesis of tRNA during rat liver regeneration were compared, using 6-orotic acid-^{14}C and ^{3}H-methyl-L-methionine as precursors in double label pulses. The amount of extractable tRNA increased (2.1-12.5%) 18-24 hr post-hepatectomy. The peaks of both ^{14}C and ^{3}H radioactivity reached a maximum before DNA synthesis reached a maximum, and increased tRNA methylation preceded tRNA synthesis by several hr during regeneration. The ratio of the relative rate of methylation to the relative rate of synthesis correlated with the rise and fall of protein synthesis during regeneration. Apparently, methylation and synthesis of tRNA are only weakly coupled, but changing methyl content of the tRNA pool resulting from differential tRNA methylase and polymerase activities may regulate the rate of protein synthesis in the cell cycle at the translational level.

7885 THE EFFECT OF PARTIAL HEPATECTOMY ON THE METABOLISM OF URETHAN IN YOUNG ADULT MICE. *(E.)* Grogan, D. E. (Dept. Biol., U. Missouri, St. Louis), M. Lane, R. A. Liebelt and F. E. Smith. *Cancer Res* 30(6):1806-1811, 1970.

Carbonyl-^{14}C urethan metabolism was studied in intact and partially hepatectomized mice 8- to 10-week-old. No major differences were noted between intact and operated mice in the urethan concentration in whole blood and liver or in subcellular fractions, DNA, and RNA of liver. Radioactivity was not detected in the blood or liver of intact and operated mice 24 hr after each of 3 injections of radioactive urethan 1 mg/g given on alternate days. Since urethan metabolism appeared to be the same in both intact and operated rats, the enhanced susceptibility of the liver after hepatectomy to the carcinogenic effect of urethan are probably due to increased rates of cell proliferation.

7886 HYDROXYLATION OF ALIPHATIC COMPOUNDS BY LIVER MICROSOMES: I. THE DISTRIBUTION PATTERN OF ISOMERIC ALCOHOLS. *(E.)* Frommer, U. (Biochem Inst. U. Giessen, Germany), V. Ullrich and H. Staudinger. *Hoppe Seyler Z Physiol Chem* 351(8):903-912, 1970.

Hydroxylation of methylcyclohexane, 2-methylbutane, 2,2-dimethylpropane, isobutane, n-pentane and n-butane was studied in liver microsomes of phenobarbital-treated rats, mice, rabbits and guinea pigs. Except for the primary alcohols of n-pentane, n-butane and isobutane all isomeric alcohols were found as hydroxylation products. Common to all substrates and independent of the species was a high ratio of the product of hydroxylation at secondary/primary CH-bonds and a preferred attack at the tertiary CH-bond compared to the secondary CH-bond. Small but significant differences were observed in the distribution of isomeric alcohols obtained by microsomal hydroxylation in different species indicating that steric differences in the active center of cytochrome P-450 do exist. Probably, due to the smallness of the substrates and their lack of functional groups, no rigid steric fixation of the compounds at the active site of the enzyme occurred, and the position of attack was influenced mainly by the reactivity of the active oxygen in microsomes.

7887 AGENTS AFFECTING LIPID METABOLISM: XXXVIII. EFFECT OF NEOMYCIN ON CHOLESTEROL BIOSYNTHESIS AND BILE ACID PREPARATION. *(E.)* Cayen, M. N. (Ayerst Res. Lab., Montreal, Quebec, Canada). *Amer J Clin Nutr* 23(9):1234-1240, 1970.

Male albino rats were fed neomycin (0.5% in the drinking water for 14 days) and liver homogenates and intestinal sections were prepared and incubated simultaneously with 2-^{14}C-acetate and ^{3}H-mevalonate and the incorporation of these precursors into cholesterol was determined. Neomycin had no effect on the incorporation of precursors into hepatic cholesterol but caused almost a twofold increase in the incorporation of ^{14}C-acetate into intestine cholesterol. A similar dose of the bile acid sequestering agent, cholestyramine, caused more than a fourfold increase in both hepatic and intestinal cholesterol formation. Neomycin had no effect on serum and liver sterols, but caused a decrease in intestine sterol levels. Buffered (pH 6.4) solutions of neomycin when added to buffered solutions of sodium salts of various bile acids formed insoluble precipitates with deoxycholate, taurodeoxycholate and taurochenodeoxycholate, but did not precipitate cholate, taurocholate, or taurodehydrocholate. The hypocholesterolemic action of neomycin in man and the chick may be mediated by precipitation of dihydroxy bile acid conjugates.

7888 METABOLISM OF ETHANOL BY RAT LIVER MICROSOMAL ENZYMES. *(E.)* Khanna, J. M. (Dept. Pharmacol., U. Toronto, Ontario, Canada), H. Kalant and G. Lin. *Biochem Pharmacol* 19(8):2493-2499, 1970.

Rat liver microsomes oxidized ethanol to acetaldehyde *in vitro* in the presence of NADPH and oxygen, at an optimal pH of 7.0-7.4. The average oxidation activity was 3.8 μmoles acetaldehyde/mg microsomal protein/min and was inhibited markedly by addition of deoxycholate, aminotriazole, cyanide and azide, but only weakly by digitonin and not at all by pyrazole or SKF 525-A (β-diethylaminoethyl-diphenylpropyl acetate). Hydrogen peroxide and barium peroxide were effective in place of NADPH and oxygen when initial reaction rates were considered; this activity was also inhibited by cyanide and by aminotriazole. Oxidation of ethanol by hepatic microsomes *in vitro* is apparently brought about by a combination of catalatic activity plus a system which generates H_2O_2 from the oxidation of NADPH, rather than by the intact mixed-function oxidase (drug-metabolizing) system.

7889 DISPLACEMENT OF ALBUMIN-BOUND BILIRUBIN BY FREE FATTY ACIDS: IMPLICATIONS FOR NEONATAL HYPERBILIRUBINEMIA. *(E.)* Starinsky, R. (Hadassah U. Hosp., Jerusalem, Israel) and E. Shafrir. *Clin Chim Acta* 29(2):311-318, 1970.

The interaction of bilirubin, linoleate and human plasma albumin was investigated in an isolated model system, designed to evaluate the competitive effect of free fatty acids on the binding of unconjugated bilirubin by albumin. Increasing amounts of linoleate were added to bilirubin-albumin solutions at a constant molar ratio, and the mixtures passed through Sephadex G-25 columns to absorb the displaced bilirubin, which was then eluted and measured. In solutions with a molar ratio of bilirubin/albumin of 0.5 or 1.0 no displacement occurred when the molar ratio of linoleate relative to albumin was below 5; above a molar ratio of linoleate/albumin of 6, free bilirubin in the system rose sharply. In solutions with a molar ratio of bilirubin/albumin of 1.8, bilirubin dissociated from albumin markedly when the molar ratio of linoleate relative to albumin approached 4. The displacement of bilirubin apparently started only after most of the free fatty acids binding sites on albumin with high association constants were saturated, and the competition involved mainly multiple binding sites with low association constants. In two groups of infants without or with hyperbilirubinemia requiring exchange transfusion, the molar ratio of free fatty acids/albumin in plasma ranged from 1.07 to 2.37. Free fatty acids in neonates, although elevated, do not seem to reach concentrations, relative to albumin, which are effective in bilirubin dissociation.

7890 THE DISTRIBUTION OF ALBUMIN SYNTHESIS THROUGHOUT THE LIVER LOBULE. *(E.)* Schreiber, G. (Inst. Biochem., U. Freiburg, Germany), R. Lesch, U. Weinssen and J. Zahringer. *J Cell Biol* 47(1):285-289, 1970.

Localization of albumin synthesis in rat liver was studied by radioautography. Injection of L-leucine-4,5-$^3H_2$(0.2 mC/100 g) into the caval vein of rats led to uniform labeling of protein throughout the liver lobule. Injection into the portal vein produced labeling of protein predominantly in the peripheral regions of the lobule. After both kinds of injection procedures, albumin was purified from liver homogenates to constant specific radioactivity. The ratio of the radioactivity incorporated into albumin to that incorporated into total protein was the same in both cases (2.8 and 3.5%); the capacity to synthesize albumin appears to be distributed equally between the peripheral and the central regions of the liver lobule.

7891 RAT LIVER OXIDATIVE N-DEALKYLASE AND N-OXIDASE ACTIVITIES AS A FUNCTION OF ANIMAL AGE. *(E.)* Das, M. L. (Dept. Chem., U. Texas, Austin) and D. M. Ziegler. *Arch Biochem Biophys* 140(1):300-306, 1970.

The enzymic NADPH and oxygen-dependent oxidations of N,N-dimethylaniline, N-methylaniline, and N-methyl-*n*-octylamine were measured in microsomes isolated from liver homogenates of rats that varied in age from 3-24 weeks. The concentration of hepatic microsomal oxidative N-dealkylase enzymes was low in weanling rats, increased to a maximum in the young adults (6.6 to 10.0 nmole/min/mg), and then remained relatively constant or decreased in the older animals. The N,N-dimethylaniline N-oxidase activity, however, was consistently highest in liver microsomes from the older animals (7.8 nmole/min/mg); microsomes from the youngest rats catalyzed N-oxidation of 30% of the total N,N-dimethylaniline oxidized, whereas 48% of the N,N-dimethylaniline oxidized was converted to the amine-oxide by microsomes obtained from the oldest animals. In normal rats, there appears to be a direct correlation between hepatic N-oxidase activity and the age of the animal whereas microsomes from all ages of animals catalyzed the oxidative N-dealkylation and N-hydroxylation of both secondary amines tested; the highest N-hydroxylase rates were observed with microsomes from the older animals.

7892 DIFFERENTIAL LONG-TERM EFFECTS OF D-CHLORAMPHENICOL ON THE BIOGENESIS OF MITOCHONDRIA IN NORMAL AND REGENERATING RAT LIVER. *(E.)* Gonzalez-Cadavid, N. F. (Fac. Sci., Central U. Venezuela, Caracas), E. M. Avila Bello and J. L. Ramirez. *Biochem J* 118(4):577-586, 1970.

D-Chloramphenicol (20 mg i.p.) was administered daily for 4 weeks to normal and partially hepatectomized rats in order to investigate whether defective mitochondria could be induced *in vivo* in higher organisms as in yeast, and to measure the degree of inhibition of the mitochondrial function thus obtained. The antibiotic did not affect growth and increased the amount of liver protein without changing the mitochondrial yield. The respiration of isolated mitochondria from regenerated liver (regeneration completed) with succinate, α-oxoglutarate, isocitrate and malate was decreased in the chloramphenicol-treated rats, whereas in normal liver the antibiotic increased the mitochondrial oxygen consumption with succinate and did not significantly change the respiration with other substrates. Mitochondrial cytochromes and respiratory enzymes were also decreased in amount in regenerated liver from the treated rats and enhanced in normal liver. The protein specific radioactivities of most mitochondrial and microsomal subfractions 30 min after an injection of ^{14}C-leucine were decreased in regenerated liver treated with chloramphenicol; the incorporation of ^{14}C-leucine into proteins of most subfractions of liver slices was enhanced in normal rats treated with the antibiotic. In regenerated liver chloramphenicol seems to induce functionally defective mitochondria by inhibiting their biogenesis, whereas in normal liver the stimulation of respiration and protein synthesis is probably a secondary detoxication response.

7893 EFFECT OF DIETARY AMINO ACIDS ON AMINO ACID-CATABOLIZING ENZYMES IN RAT LIVER. *(E.)*

Nakano, K. (Dept. Agric. Chem, Nagoya U., Japan), T. Kishi, N. Kurita and K. Ashida. *J Nutr* 100(7): 827-836, 1970.

The effect of dietary amino acids on the level of hepatic tryptophan pyrrolase, threonine dehydratase and arginase was studied by their forcible administration to rats depleted of protein. Of 12 amino acids tested, only tryptophan and methionine caused a consistent increase in enzyme activities (tryptophan pyrrolase increased from 4 to 10 μmole/hr/liver). Feeding rats an equimolar complete amino acid mixture resulted in a maximal induction of the enzyme whereas the omission of both tryptophan and methionine caused little or no induction. The administration of these 2 functional amino acids did not cause any significant increase in the level of plasma urea, compared with that caused by the feeding of the complete amino acid mixture. In adrenalectomized rats hepatic tryptophan pyrrolase, which can be increased in intact rats by feeding either tryptophan or methionine, was activated and increased by feeding tryptophan but not methionine; the feeding of tryptophan and methionine resulted in a significant increase in the level of arginase and threonine dehydratase. Administration of cortisone acetate (5 mg) produced a significant increase in the level of all three enzyme activities. The level of amino acid-catabolizing enzymes in the liver of rats fed either tryptophan or methionine apparently can be elevated by hormone (adrenal) mediated and hormone independent mechanisms.

7894 DEVELOPMENT AND REGRESSION OF MORPHOLOGICAL AND BIOCHEMICAL CHANGES IN HAMSTERS AND MICE FED A CHOLESTEROL CHOLIC ACID CONTAINING DIET. *(E.)*

Bergman, F. (Surg. Clin. U. Umea, Sweden), A. H. Juul and W. Van Der Linden. *Acta Path Microbiol Scand* 78(2):179-191, 1970.

The morphological and biochemical changes in hamsters and mice fed a cholesterol cholic acid containing diet for 1 month were hepatomegaly, steatosis of the liver and high serum cholesterol levels accompanied by a massive accumulation of intracellular lipid droplets and birefractive cholesterol crystals in the parenchymal and Kupffer cells. Gallbladders were distended with atrophy of the mucous membrane in both species. The liver histology in mice returned to normal when the diet was changed to chow, but not in hamsters. The thyroid gland became hyperplastic with tightly packed irregular follicles lined with columnar epithelium in hamsters, but hypoplastic with dilated follicles filled with strongly PAS positive colloid in mice. The anterior pituitary gland of hamsters but not of mice showed an increase of so-called thyroidectomy cells, and an increase of stainable lipids was found in the adrenal cortex of both species. Since the endocrine glandular changes disappeared in both species, while livers of hamsters remained steatotic, the theory that thyroid hyperplasia is due to stimulation by the increased metabolic needs of the liver seems unlikely. In both hamsters and mice, the diet resulted in a decrease of the chenodeoxycholic acid concentration of the bile (control, 236 and 193 mg %; diet, 79 and 37 mg %, resp.), probably due to a diminished synthesis of this bile acid as a result of the continuous supply of cholic acid to the liver. The biliary deoxycholic acid concentration rose strikingly (control 260 mg %; diet 830 mg %) in hamsters, but not in mice, probably because hamsters cannot convert deoxycholic to cholic acid. A fall of the dihydroxy/trihydroxy bile acid ratio was noticed in mice, in which species gallstones eventually formed; whereas this ratio rose in hamsters, in which gallstones were not formed. Dissolution of gallstones accompanied by a drastic shift towards cholic acid occurred when the diet was extended for a longer period and it was found that the biliary acids/cholesterol ratio fell to much lower values in mice than in hamsters. When the diet was discontinued there was an unexplained rise of the chenodeoxycholic acid concentration in hamsters but not in mice.

7895 THE ALDEHYDE REACTION WITH BILIRUBIN OF BILE AND OF BILE PIGMENT IN THE ICTERIC LIVER. *(E.)*

Lillie, R. D. (Louisiana St. U. Sch. Med., New Orleans) and P. Pizzolato. *Virchows Arch Path Anat* 350(1):52-60, 1970.

Golden brown bile promptly turned green, even under oil, by addition of various aliphatic and aromatic aldehydes, such as formaldehyde, paraldehyde, chloral hydrate, isobutyraldehyde, glyoxal, glyoxalic acid, glutaraldehyde, benzaldehyde, *p*-dimethylaminobenzaldehyde and vanillin. With formaldehyde this color change was accompanied by spectroscopic alterations and by a decrease in bilirubin assay by the Malloy-Evelyn technic. Brown yellow icteric liver tissue was similarly colored green by immersion in formaldehyde, paraldehyde, chloral hydrate, benzaldehyde and *p*-dimethylaminobenzaldehyde, and was returned to yellow by reducing agents such as sodium bisulfite or thiosulfate, ferrous salts, acetone, and alcohols such as methyl, ethyl and ethylene glycol; this color cycle may be repeated at least three times. Formaldehyde also oxidizes ferrous salts to ferric, as well as reducing ferric salts to ferrous, incompletely in both instances, so that ferroso-ferric mixtures result. The weight of ferrous ferricyanide precipitates indicated a 16% oxidation of a ferrous sulfate solution and a 30% reduction of a ferric chloride solution. These two salts resp. reduced biliverdin to bilirubin and oxidized bilirubin to biliverdin in histochemical studies.

7896 CHOLINE AND BETAINE ALDEHYDE OXIDATION BY RAT LIVER MITOCHONDRIA.

(E.) Wilken, D.R. (Va. Hosp., Madison, Wisc.), M. L. McMacken, and A. Rodriquez. *Biochim Biophys Acta* 216(2):305-317, 1970.

Betaine aldehyde dehydrogenase (7% of the postnuclear enzyme) was demonstrated in well-washed mitochondria, equally distributed between the inner membrane and the inter-membrane plus matrix fractions; none was found in the outer membrane fraction. The mitochondrial enzyme was shown to be functional under all the conditions tested; betaine aldehyde generated within the mitochondria by choline oxidation or added externally was oxidized to betaine in significant amounts. The stoichiometry for the complete oxidation of choline or externally added betaine aldehyde was confirmed to be 2 and 1 moles, respectively, of O_2 utilized per mole of substrate added. Depending on the reaction conditions employed, considerable variation in the relative amount of choline oxidase and betaine aldehyde oxidase activities of mitochondria was observed when they were allowed to oxidize only a portion of the choline added.

7897 NEONATAL DIFFERENCES IN THE INDUCTION OF HEPATIC AMINOLEVULINIC ACID SYNTHETASE.

(E.) Woods, J. S. (Sch. Med., U. Washington, Seattle) and R. L. Dixon. *Biochem Pharmacol* 19(6): 1951-1954, 1970.

The induction of hepatic aminolevulinic acid synthetase by 3,4-dicarbethoxy-1,4-dihydrocollidine (500 mg/kg s.c. for 1-3 days) was studied in neonatal and adult rabbits. The basal activity *in vitro* of the aminolevulinic acid synthetase in newborn rabbits (32 nmole/g/hr) is 6-8 times that seen in adult animals, and the neonatal animals were relatively much less responsive to the inducing agent than the adult rabbits. The basal enzyme activity in newborn animals was only doubled while, in contrast, the synthetase activity in adult animals was increased 19-fold. The regulation of the synthesis of hepatic heme in neonatal animals may be less strictly controlled than in adults, indicating that synthesis of aminolevulinic acid synthetase during the neonatal period is semiconstitutive.

7898 STUDIES ON THE MECHANISM OF ENZYME INDUCTION: XV. INDUCTION PATTERNS AND SUBMICROSCOPIC CHANGES IN THE LIVER FOLLOWING PHENYLBUTAZONE IN RATS OF DIFFERENT AGES

(E.) Klinger, W. (Inst. Pharmacol. Toxicol., Friederich Schiller U., Jena, Germany), J. Elger, H. Franke, C. Reinicke, A. Traeger, H. Volkmann, I Wahrenberg and H. Ankermann. *Acta Biol Med German* 24(4):463-482, 1970.

Enzyme induction (liver fresh weight variations, hexobarbital sleeping time, aminophenazone N-demethylation, ascorbic acid excretion) and fine structure alterations of the liver were studied in pregnant rats, their fetuses, 5-, 10-day and 7-month-old rats following 3 treatments with phenylbutazone (50 to 200 mg/kg i.p.). Seven months old rats were additionally treated with phenylbutazone (50 and 100 mg/kg daily) for 1 month, and an increase in liver weight from 12 to 15 g was noted. Hexobarbital sleeping time (100 mg/kg) decreased from 150 min to 82 min in the 10-day-old group and aminophenazone N-demethylation (9000 x g liver homogenate supernate) was doubled in the same age group (50 mg/kg dose). Liver ascorbic acid concentrations increased slightly (from 0.22 to 0.27 mg/g liver) in the 5-day-old group (50 mg/kg dose), and no changes were noticed in fetuses of treated pregnant animals. Electron microscopy revealed no liver cell alterations in fetuses, while moderate proliferation of membranes of the smooth endoplasmic reticulum was seen in the 5- and 10-day-old groups. An overall increase in smooth endoplasmic reticulum was seen in the 7-month-old rats and pregnant rats (15th and 22nd day of pregnancy) and a general increase in lysosomes and atypical mitochondrial fine structures were also noticed. Both acute and subchronic phenylbutazone treatment of new-born and adult rats produced severe intrahepatic cholestasis.

7899 EFFECT OF SIZE ON THE RELATIVE RATE OF DEGRADATION OF RAT LIVER SOLUBLE PROTEINS.

(E.) Dehlinger, P. J. (Stanford U. Sch. Med., Calif.) and R. T. Schimke. *Biochem Biophys Res Commun* 40(6):1473-1480, 1970.

The effect of size on the relative rate of degradation of rat liver soluble proteins was investigated using a double isotope method (^{3}H-L-leucine and ^{14}C-L-leucine) to determine the relative turnover rates. The proteins of the supernatant fraction were separated on Sephadex G-200 both in the presence and absence of sodium dodecylsulfate, giving a size distribution based on subunit molecular weight (with sodium dodecyl sulfate and multimeric molecular weight (buffer alone). In both cases, greater degradation rates were associated with greater molecular weights.

7900 RELATION OF STEROID STRUCTURE TO ENZYME INDUCTION IN HEPATOMA TISSUE CULTURE CELLS.

(E.) Samuels, H. H. (New York U. Sch. Med., New York) and G. M. Tomkins. *J Molec Biol* 52(1):57-74, 1970.

The relation of steroid structure to tyrosine aminotransferase induction in hepatoma tissue culture cells was investigated. A wide variety of steroids were classified into 4 groups and defined as optimal inducers, sub-optimal inducers, anti-inducers and inactive compounds. Optimal inducers were cortisol, dexamethasone and corticosterone; concentrations which induced half maximally the steady state tyrosine aminotransferase activity were 6 X 10^{-8}, 8 X 10^{-9}, 3 X 10^{-7}M, resp. Sub-optimal inducers were 11β-OH progesterone, 11-deoxycortisol and deoxycorticosterone which induced the enzyme to a submaximal but characteristic level (35, 25 and 46% of maximum, resp.). When 11β-OH progesterone (1 X 10^{-5}M) was added to cortisol (1 X 10^{-7}M), the steady-state enzyme activity was not the sum of the individual steady-state levels, but was close to that induced by the sub-optimal inducer alone (combined 43%; alone 35%), indicating that sub-optimal inducers competitively inhibited induction by optimal inducers. Anti-inducers, testosterone and 17α-methyltestosterone, could not induce the enzyme, but competitively inhibited induction by optimal inducers. Inactive steroids (epicortisol, androstenedione, 20α-hydroxycortisol) neither induced nor inhibited enzyme induction. These differences in steroid behavior apparently do not result from differences in steroid uptake or metabolism, or from an effect on general cell protein synthesis or degradation of enzyme, but are probably due to the interaction of these steroids with an allosteric receptor system concerned with the regulation of synthesis of enzyme.

7901 MECHANISM OF CHOLESTASIS: I. EFFECT OF BILE ACIDS ON MICROSOMAL CYTOCHROME P-450 DEPENDENT BIOTRANSFORMATION SYSTEM *IN VITRO*. *(E.)* Hutterer, F. (Mount Sinai Sch. Med., City U., New York, N. Y.), H. Denk, P. G. Bacchin, J. B. Sckenkman, F. Schaffner and H. Popper. *Life Sci* 9(15):877-887, 1970.

The interaction of bile acids with isolated rat liver microsomes was studied *in vitro* and the change in cytochrome P-450 activity was compared with biotransformation rates seen in cholestatic rats. A Type I spectrum was obtained when 0.1 to 0.6 mM bile acids (except trihydroxyacids) were added to isolated microsomes, and aminopyrine, a Type I substrate, was competitively inhibited by these bile acids which also increased the activity of the NADPH-cytochrome P-450 reductase. Longer exposure of microsomes to higher concentrations of bile acids caused irreversible blocking or removal of the Type I binding site and a 70% inhibition of the Type I substrate metabolism. The metabolism of aniline, a Type II substrate, and the cytochrome P-450 content of the microsomes were unaffected by bile acids although increase of the bile acid concentration to 1.2 mM caused the degradation of cytochrome P-450 and a parallel decrease in the metabolism of Type II substrates. In rats with ligated bile ducts a corresponding decrease in the metabolism of Type I substrates and then of Type II substrates as well was observed. The molecular interaction of bile acids with microsomal cytochrome P-450 is probably responsible for the decreased activity of the hepatocellular biotransformation system in cholestasis.

7902 THE DISTRIBUTION AND SYNTHESIS OF DNA IN TWO CLASSES OF RAT LIVER NUCLEI DURING AZO DYE-INDUCED HEPATOCARCINOGENESIS. *(E.)* Sneider, T. W. (Baylor Coll. Med., Houston, Tex.), D. E. Bushnell and V. R. Potter. *Cancer Res* 30(6):1867-1873, 1970.

Nuclei from homogenates of livers from rats fed the hepatocarcinogen 3-methyl-4-dimethylaminoazobenzene (0.05% of diet) were separated into class N-I (hepatocyte) nuclei and class N-II (nonhepatocyte, "stromal") nuclei by discontinuous sucrose gradient centrifugation. Although 80% of the DNA was associaed with N-I nuclei at the beginning of the experiment, only about 25% could be recovered in the N-I fraction after 14 days of dye feeding. By the end of the experiment (42 days of continuous dye administration), the total liver DNA was approximately equally distributed between N-I and N-II nuclei. Alterations in the N-I/N-II ratio prior to 14 days occurred in the absence of increased DNA synthesis. Although there was a high degree of thymidine-methyl-^{3}H-labeling of DNA of both classes of nuclei after 14 days on the dye diet, much of the labeled DNA could not be recovered from livers of rats given injections of isotope earlier in the regimen and killed after 42 days on the dye diet.

7903 THE PHYSIOLOGICAL ROLE OF LIVER ALCOHOL DEHYDROGENASE. *(E.)* Krebs, H. A. (Radcliffe Infirm., Oxford, England) and J. R. Perkins. *Biochem J* 118(4):635-644, 1970.

Endogenous ethanol levels were determined with yeast alcohol dehydrogenase in the portal and hepatic veins and alimentary canal of rats given an ethanol-free diet. The mean alcohol concentration in the portal blood of normal rats was 0.045 mm and in the hepatic vein, inferior vena cava and aorta it was about 15 times lower. The contents of all sections of the alimentary canal contained measurable amounts of ethanol with the highest values (average 3.7 mm) found in the stomach. Infusion of pyrazole (an inhibitor of alcohol dehydrogenase) raised the alcohol concentration in the portal vein 10-fold and almost removed the difference between portal and hepatic venous blood. Addition of antibiotics to the food diminished the ethanol concentration of the portal blood to less than one-quarter and that of the stomach contents to less than one-fortieth. The concentration of alcohol in the alimentary canal and in the portal blood of germ-free rats was decreased to less than one-tenth in the alimentary canal and to one-third in the portal blood, but detectable quantities remained, probably formed from acetaldehyde resulting from the normal pathways of degradation of threonine, deoxyribose phosphate and β-alanine. Significant amounts of alcohol seem to be normally formed in the gastro-intestinal tract, absorbed into the circulation and almost quantitatively removed by the liver. Thus the function, or a major function, of liver alcohol dehydrogenase is the detoxication of ethanol normally present.

7904 THE DEVELOPMENT OF A TRANSIENT FATTY LIVER AFTER RELEASE FROM A TEN DAY STAY IN HYPOXIA CORRESPONDING TO AN ALTITUDE OF 600 m. *(Ger.)* Tribukait, B. (Karolinska Inst., Stockholm, Sweden) and K. Lindberg. *Beitr Path Anat* 140(4):419-429, 1970.

The liver fat contents of mice (22g) was increased by about 40% immediately after a 10-day stay in a chamber which had a pressure of 354 mm Hg, corresponding to altitude of 6000 m. Immediately after termination of the exposure, the hepatic fat showed a striking centrilobular accumulation; the fat content continued to increase, reaching twice the norm on the 4th day, showing histologically, at this time, a diffuse distribution. The composition of the liver returned to the level of controls 10 days after termination of exposure, although its weight was still moderately increased. The mice lost 10-20% body weight during the high altitude experiment, which they regained about 14 days after return to their normal environment. The hepatic changes were attributed to hypoxia, and may be related to increased radiation resistance.

7905 THE METABOLIC RESPONSE OF THE LIVER TO PORTACAVAL SHUNT. *(E.)* Smith, G. W. (U. Virginia Sch. Med., Charlottesville) and G. I. Mouzas. *Surgery* 68(2):341-349, 1970.

The effects of side-to-side and end-to-side portacaval shunts were compared in normal dogs on body and liver weight, liver blood flow, hepatic oxygen consumption, glucose metabolism, and ammonia clearance. Total body weight and liver weight were unaffected by a side-to-side shunt but were decreased approximately 20% after end-to-side shunt. Liver blood flow was reduced by both operations, but the reduction was 25% more in the end-to-side shunt. Hepatic oxygen consumption was similarly diminished in both groups, but again the change was 22% greater after end-to-side shunt. These changes resulted in only suggestive impairment of glucose metabolism, but ammonia clearance was decreased, especially by an end-to-side shunt. All of the physiologic and biochemical alterations were sustained in both groups for 1-3 months. Either type of shunt seemingly can cause hepatic metabolic derangements and a portacaval shunt may be poorly tolerated by patients with initially good liver blood flow.

7906 TRANSFER RNA PATTERN IN LIVERS OF RATS FED DIETS CONTAINING 3'-METHYL-4-DIMETHYLAMINOAZOBENZENE. *(E.)* Goldman, M. (U. Texas M.D. Anderson Hosp. Tumor Inst., Houston) and A. C. Griffin. *Cancer Res* 30(6):1677-1680, 1970.

Comparisons were made of the reversed phase chromatography profiles of transfer RNA's (tRNA) prepared from the livers of normal rats and of rats fed a diet containing the hepatocarcinogen 3'-methyl-4-dimethylaminoazobenzene over an 8 week period and charged with ^{14}C- and ^{3}H-labeled amino acids. Portions of the lysyl-, leucyl-, phenylalanyl-, and tyrosyl-tRNA peaks from the precancerous livers were eluted from the columns earlier than the corresponding tRNA of normal livers. Minor differences in the patterns were observed for glutamyl- and isoleucyl-tRNA, but the patterns of arginyl-, seryl-, valyl-, histidyl-, threonyl-, and methionyl-tRNA's of normal and precancerous livers were identical. *In vitro* methylation of phenylalanyl- and tyrosyl-tRNA resulted in profiles similar to those in precancerous liver, suggesting that the altered tRNA's of precancerous livers may have undergone methylation by the hepatocarcinogen; alternatively, tRNA's of other cellular types have been reported in the livers of dye-fed animals, and these tRNA's may exhibit different patterns from normal liver tRNA.

7907 THE METABOLISM OF RIBONUCLEIC ACID IN RAT LIVER AFTER PHENOBARBITAL ADMINISTRATION. *(E.)* Ruddon, R. W. (U. Michigan Med. Dent. Sch., Ann Arbor) and A. M. Cohen. *Molec Pharmacol* 6(5):540-547, 1970.

The effect of phenobarbital (75 mg/kg i.p.) on the relation between RNA metabolism and enzyme induction in rat liver was studied by following the incorporation of orotic acid-5-^{3}H (100-200 μC) into hepatic nuclear and cytoplasmic RNA extracted from purified nuclei or cytoplasmic fractions and separated on linear sucrose gradients. Pulses of 1-, 2-, 4-, and 12-hr duration were administered 2 hr after injection of phenobarbital or 0.9% NaCl in order to examine alterations in cytoplasmic RNA metabolism early in the induction process before any marked increase occurred in the levels of microsomal drug-metabolizing enzymes. A 20-30% increase above controls in the specific activity of 28 S and 18 S ribosomal RNA became apparent after a 2-hr pulse dose of labeled precursor administered 2 hr after phenobarbital treatment, and was maintained for 12 hr. The augmented labeling appeared to be restricted to ribosomal RNA species. Analysis of nuclear RNA after pulses of ½, 1, 2, and 4 hr, given 2 hr after phenobarbital, indicated that there was no detectable increase in the synthesis of ribosomal RNA or ribosomal RNA precursors. Phenobarbital may enhance the stability of hepatic ribosomal RNA or increase the "processing" and transport of this substance to the cytoplasm, and these events, which occur early in the induction process, may be involved in the elevation of microsomal oxidase activity observed after phenobarbital administration.

7908 GENETIC INFLUENCES ON RESPONSE TO CASTRATION OF LIVER GROWTH AND HEPATOMA FORMATION. *(E.)* Wolff, G. L. (Inst. Cancer Res., Fox Chase, Philadelphia, Pa.). *Cancer Res* 30(6):1726-1730, 1970.

The effect of castration on liver weight and composition was studied in various mouse genotypes which differ in their susceptibility to formation of spontaneous hepatomas. In the YS strain, the lethal yellow (A^y) gene induced an increase in fat-free dry weight of the liver in castrated males. Castration did not affect liver weight of the nonyellow (a/a) YS/ChWf males. Fat-free dry carcass weight of the A^y/a males was not affected by castration, but that of the a/a males was decreased. In livers of both genotypes, castration decreased the water content and essentially had no effect on the fat content; however, castration did increase the fat content of the carcasses markedly in both genotypes. Decreased liver weight as a result of castration was observed in all nonyellow F_1 hybrids carrying the VY strain genome, but in only one yellow

(A^{vy}/A) F_1 hybrid class (BALB/c X VY). The YS strain genome apparently eliminated this response in F_1 hybrid males carrying the hepatoma-resistant BALB/c and C57BL/6 strain genomes. Castration did retard liver weight gain in the inbred BALB/c and C57BL/6 strain males. This effect of castration was not observed in the hepatoma-susceptible C3H strain males. Ovariectomy of A^{y}/a and a/a YS females had the same effects on liver and carcass weight as castration of the yellow and nonyellow males of this strain. Apparently the effect of castration on liver weight is not directly induced by decreased levels of sex hormones, but rather by alteration of the hormonal balance.

7909 ON THE RELATIONSHIP OF LIVER MITOCHONDRIAL COENZYME Q TO HYPERTHYROIDISM IN RATS. *(E.)* Butler, M. M. T. (Dept. Biochem., Colorado St. U., Fort Collins) and I. W. Charkey. *Proc Soc Exp Biol Med* 134(3):625-629, 1970.

The effect of administration to rats of excess thyroid hormone on mitochondrial coenzyme Q and on the functional efficiency of mitochondrial oxidative phophorylation was studied. Liver mitochondria from rats with induced hyperthyroidism (0.4% dessicated thyroid in diet) were less efficient as energy transducers than controls, as judged by lower P/O ratios (0.7 and 2.9, resp.). Liver mitochondria from hyperthyroid rats contained more coenzyme Q than did controls (14.4 vs 5.4 μg/mg N). Coenzyme Q probably was not involved as an intermediate for phosphorylation, but rather in the hyperthyroid state was in an alternate pathway of electron transport by-passing phosphorylation.

7910 MESSENGER RIBONUCLEOPROTEIN COMPLEXES RELEASED FROM RAT LIVER NUCLEI BY ATP: I. CHARACTERIZATION OF THE RNA MOIETY OF MESSENGER RIBONUCLEOPROTEIN COMPLEXES. *(E.)* Ishikawa, K. (Niigata U. Sch. Med., Japan), C. Kuroda, M. Ueki and K. Ogata. *Biochim Biophys Acta* 213(2):495-504, 1970.

The chemical and metabolic properties of the RNA moiety of the 45 S component which can be released from rat liver nuclei by ATP were investigated. Disc electrophoresis of RNA from the 45 S component labeled with ^{14}C-orotic acid *in vivo* for 40 min revealed that it contained rapidly labeled RNA ranging from 18 S to 6-4 S as the main component. RNA from the 45 S component showed a high stimulatory activity for polypeptide synthesis in an *Escherichia coli* cell-free system. Base composition analysis of RNA from the 45 S component showed a high adenine + uridine/guanidine + cytosine ratio, as obtained both by the ultraviolet absorption method (1.17) and by the measurement of radioactivity after ^{32}P short-labeling (1.18). The 45 S component appears to contain mRNA as a major component.

7911 MESSENGER RIBONUCLEOPROTEIN COMPLEXES RELEASED FROM RAT LIVER NUCLEI BY ATP: II. CHEMICAL AND METABOLIC PROPERTIES OF THE PROTEIN MOIETY OF MESSENGER RIBONUCLEOPROTEIN COMPLEXES. *(E.)* Ishikawa, K. (Niigata U. Sch. Med., Japan), C. Kuroda and K. Ogata. *Biochim Biophys Acta* 213 (2):505-512, 1970.

The protein moiety of messenger ribonucleoprotein complexes, the 45 S component released from rat liver nuclei by ATP, was investigated. Polyacrylamide gel electrophoresis revealed that the 45 S component contained proteins which were less basic than ribosomal basic proteins and histones and showed 3 main bands. The amino acid composition of the protein moiety of the 45 S component indicated that the content of basic amino acids (13.8 moles/100 moles amino acid recovered) in the 45 S component was about a half of those in ribosomal sub-units. The time courses of labeling *in vivo* with the ^{14}C-labeled algal protein hydrolysate showed that the specific activity of the released fraction reached a value twice as high as that of total nuclear proteins after 1 hr; the specific activity of the 45 S component was lower than that of the 4 S component. The 45 S component, which may be an intermediate form of transport for mRNA, apparently contained specific carrier proteins, which are less basic than ribosomal structural proteins and have a rather high metabolic rate.

7912 IMPAIRED LABELING OF LIVER PHOSPHATIDYLETHANOLAMINE FROM ETHANOLAMINE-^{14}C IN CHOLINE DEFICIENCY. *(E.)* Haines, D. S. M. (Westminster Hosp., London, Ontario, Canada)and C. I. Rose. *Canad J Biochem* 48(8):885-892, 1970.

Ethanolamine-^{14}C (0.5 ml, 3.5 μC) was injected intraportally to 8 rats after 3 days of choline-deficient feeding and to choline-supplemented rats which were killed in groups of two after 4, 8, 18, and 32 min. Much less ^{14}C was incorporated into phosphatidylethanolamine and phosphatidylcholine in the choline-deficient livers, while the level of the former phospholipid was increased and the latter was decreased in these livers. In choline-deficient liver the levels of ethanolamine and its derivatives were increased 4-fold compared to choline-supplemented liver, while choline and choline phosphate were reduced 90% and 80%, resp. A lower incorporation of ethanolamine-^{14}C into cytidinediphospho-ethanolamine (15%) was seen in the deficient livers whereas the specific radioactivities of ethanolamine and ethanolamine phosphate were increased. A block at the cytidinetriphosphate:ethanolamine phosphate transferase step of phosphatidylethanolamine synthesis appears to exist in choline-deficient liver.

7913 PROSTAGLANDIN UPTAKE AND METABOLISM BY THE PERFUSED RAT LIVER. *(E.)* Ramwell, P. W. (Alza Co., Palo Alto, Calif.), W. Dawson, S. J. Jessup, W. McDonald-Gibson and J. E. Shaw. *Brit J Pharmacol* 39(3):585-598, 1970.

The removal of prostaglandin E_1 and prostaglandin $F_{1\alpha}$ from the circulating blood and their subsequent metabolism by the isolated perfused rat liver was investigated by determing the distribution of radioactivity within extracts of bile, blood and liver following i.v. administration of labeled prostaglandin. Up to 89-95% of a single injection of 1-^{14}C-prostaglandin was removed by the liver on a single passage; only 0.3-0.8% of the radioactivity was detected in the bile and 11-19% of the label was present as exchanged $^{14}CO_2$. The rest of the radioactivity was detected within the liver incorporated into fatty acids and phospholipids. Injection of 5,6-^{3}H-prostaglandin E_1 resulted in a 30-fold increase in the % radioactivity excreted in the bile, suggesting that biliary excretion may be a major route for elimination of compounds smaller than C20 prostaglandin; similar biliary excretion of 9-^{3}H-prostaglandin F_1 occurred. A rapid uptake of circulating prostaglandins by the rat liver, followed by decarboxylation (and inactivation) apparently serves to curtail the duration of effects of prostaglandin.

7914 EFFECT OF FLUORIDE ON GLYCOLYTIC AND CITRIC ACID CYCLE METABOLITES IN RAT LIVER.

(E.) Shearer, T. R. (U. Oregon Dent. Sch., Portland) and J. W. Suttie. *J Nutr* 100(7):749-756, 1970.

The effect of an i.p. injection of 2 mg of fluoride or the ingestion of diets containing 450 or 600 ppm fluoride on the concentrations of various rat liver glycolytic and citric acid cycle metabolites was studied. Fluoride injection substantially increased liver fluoride (treated 7.4, control 0.15 ppm); and caused a large fall in metabolites between 2-phosphoglycerate and phosphoenolpyruvate and a crossover between phosphoenolpyruvate and pyruvate. The ingestion of dietary fluoride caused a decrease in the level of most glycolytic intermediates, particularly pyruvate (0.2 to 0.07 µmole/g wet wt) and lactate (1.93 to 0.84 µmole/g wet wt), and a large increase in liver citrate (0.32 to 0.85 µmole/g wet wt). Fluoride ingestion appeared to be associated with a decreased activity of liver pyruvic kinase, but it did not influence liver enolase activity. With the exception of the increase in citrate, the changes seen were shown to be secondary to a primary effect of dietary fluoride on the amount and pattern of food intake.

7915 CLEAVAGE OF HIGH-MOLECULAR WEIGHT DNA-LIKE RNA BY A NUCLEASE PRESENT IN 30 S RIBONUCLEOPROTEIN PARTICLES OF RAT LIVER NUCLEI.

(E.) Niessing, J. (Physiol. Chem. Inst., Phillips U., Marburg, Germany) and C. E. Sekeris. *Biochim Biophys Acta* 209(2):484-492, 1970

High molecular weight DNA-like RNA (50-80 S) was labeled by injection of radioactive orotic acid into rats 15 min prior to sacrifice and isolated from the livers by thermal phenol fractionation and incubated with the protein component of 30 S nuclear ribonucleoprotein particles. At a pH optimum around 8.0, low concentrations of protein (5 µg/ml) caused an almost complete conversion of the high-molecular-weight RNA into material mainly sedimenting at 30 S; prolongation of the incubation time had no effect on the rate of RNA breakdown. By increasing the concentration of the protein (30-40 µg/ml) most of the RNA present in the 30 S region was degraded to 18 S RNA and further to molecules sedimenting between 4 and 16 S. As shown by phenol extraction, no protein was attached to the degraded RNA. The cleavage of high molecular weight RNA was strongly promoted by inorganic orthophosphate. The protein from 30 S nuclear particles seemed to contain an endonuclease which *in vivo* might be involved in the cleavage of high molecular weight DNA-like RNA.

7916 INCORPORATION OF NUCLEAR RNA INTO POLYSOMES IN A RECONSTITUTED SYSTEM OF RAT LIVER.

(E.) Ishikawa, K. (Niigata U. Sch. Med., Japan), M. Ueki, K. Nagai and K. Ogata. *Biochim Biophys Acta* 213(2):542-544, 1970.

The mechanism of the incorporation of messenger RNA from the nucleus into cytoplasmic polysomes was studied in rat liver cells using a reconstructed system of isolated liver nuclei containing rapidly labeled RNA and the postmitochondrial fraction. An incubation mixture containing 40-min labeled nuclei (^{3}H-orotic acid at 100 µC/100 g body weight for 40 min), ATP, GTP, and an energy regenerating system was analyzed on sucrose density gradients after 30 min at 30°C; the rapidly labeled RNA was released from the nuclei mainly as the 45 S component when incubated with the 150,000 x g supernatant fraction and mainly in the polysome area when incubated with the postmitochondrial fraction. Without the ATP, GTP, and energy-regenerating system, neither the 45 S component release nor the polysomal incorporation occurred. Cesium chloride gradients have indicated that the rapidly labeled RNA in mammalian polysomes exist as ribonucleoprotein complexes of low bouyant density and about half of the RNA can be separated from the ribosomes with EDTA treatment.

7917 RELEASE OF CHOLINESTERASE FROM RAT LIVER BY NICOTINAMIDE AND CARBON TETRACHLORIDE.

(E.) Bhatnagar, S. P. (Food Drug Res. Lab., Ottawa, Canada). *Biochem Pharmacol* 19(6):2009-2016, 1970.

The influence of CCl_4 and nicotinamide on the concentration of cholinesterase in liver and plasma was studied in normal and ethyl-*p*-nitrophenyl thiobenzene phosphonate-treated female rats. The cholinesterase content of liver declined by about 80 per cent in 18 hr after oral administration of CCl_4 (1.25 ml/kg) to normal rats, whereas the plasma cholinesterase levels increased substantially within 8 hr, but then declined rapidly to reach the basal values within a 24-hr period. Nicotinamide failed to prevent the CCl_4-induced release of cholinesterase from liver at doses (500 mg/kg i.p. twice at 8-hr intervals) known to be effective against the hepatotoxic action of CCl_4. Instead, it caused about 50% reduction in the content of liver with the consequent elevation of the plasma enzymic levels; these effects were dose related and reversible. The decline in plasma cholinesterase activity subsequent to ethyl-*p*-nitrophenyl thiobenzene phosphonate treatment was significantly less in nicotinamide-treated animals and almost negligible in CCl_4-treated ones. Nicotinamide had no effect *in vitro* on cholinesterase activity, nor did it reactivate the enzyme inhibited *in vivo* as a result of ethyl-*p*-nitrophenyl thiobenzene phosphonate administration. The protective effect of nicotinamide was characterized by a 2- to 3-fold increase in the LD_{50} value and some prolongation of the survival time, whereas CCl_4, while failing to influence the LD_{50} value, exerted greater effect on the survival time.

7918 STUDIES ON THE INHIBITORY EFFECTS OF VARIOUS SUBSTANCES ON DRUG METABOLISM BY LIVER MICROSOMES: THE EFFECT OF NICOTINAMIDE IN ALTERING THE APPARENT MECHANISM OF INHIBITION.

(E.) Sasame, H. A. (Natl. Heart Inst., Bethesda, Md.) and J. R. Gillette. *Biochem Pharmacol* 19(3):1025-1041, 1970.

The inhibitory effects of nicotinamide, 2,4-dichloro-6-phenylphenoxyethylamine, and aminoethyldiphenylpropylacetate on the hydroxylation of aniline, and the N-demethylation of aminopyrine and ethylmorphine by liver microsomes were studied and were found to vary with the species and the substrate. Nicotinamide blocked the aminopyrine demethylating enzyme in rat liver microsomes competitively, and that in mouse liver microsomes by a mixed mechanism. The aniline hydroxylating enzyme in mouse liver microsomes was blocked competitively by nicotinamide, uncompetitively by aminoethyldiphenylpropylacetate and partially uncompetitively by 2,4-dichloro-6-phenylphenoxyethylamine. The ethylmorphine demethylating enzyme in mouse liver microsomes was inhibited by nicotinamide, 2,4-dichloro-6-phenylphenoxyethylamine, and aminoethyldiphenylpropylacetate by dual mechanisms. At low concentrations, the inhibitors blocked the reaction noncompetitively, but at high concentrations they block it both competitively and noncompetitively; nicotinamide modified the apparent mechanism of inhibition by these inhibitors. In the presence of nicotinamide, aminoethyldiphenylpropylacetate apparently inhibits the N-demethylation of ethylmorphine by a competitive mechanism.

7919 ABNORMALITIES IN HEPATIC ENZYME ACTIVITIES DURING DEVELOPMENT OF DIABETES IN Db MICE.

(E.) Chang, A. Y. (Upjohn Co., Kalamazoo, Mich.) and D. I. Schneider. *Diabetologia* 6(3):274-278, 1970.

Changes in 7 hepatic enzymes during the development of diabetes in C57BL/Ks mice were determined at 1, 2, and 4 1/2 month. An elevation in phosphoenolpyruvate carboxykinase and glucose-6-phosphatase was observed before the onset of hyperglycemia in db mice at the age of 1 month. At 2 months, these mice had hyperglycemia, hyperinsulinemia and high levels of phosphoenolpyruvate carboxykinase, glucose-6-phosphatase, fructose-1,6-diphosphatase, pyruvate kinase and 6-phosphogluconate dehydrogenase. The 4 1/2-month-old db mice had normal plasma insulin, severe hyperglycemia, exorbitant amount of hepatic gluconeogenic enzymes and reduced quantity of glycolytic and pentose-phosphate shunt enzymes. The disturbance in enzyme activities and blood sugar was partially controlled by placing the animals on a limited diet beginning at the age of 1 month. *In vivo* studies indicated that hyperglycemia resulted, at least in part, from an accelerated rate of gluconeogenesis.

7920 EFFECT OF DRUG PRETREATMENT ON CARBON TETRACHLORIDE-INDUCED LIPID PEROXIDATION IN RAT LIVER MICROSOMES.

(E.) Rao, K. S. (Sch. Med., Case Western Reserve U., Cleveland, O.), E. A. Glende, Jr. and R. O. Recknagel. *Exp Molec Path* 12(3):324-331, 1970.

The effect of drug pretreatment on CCl_4-induced lipid peroxidation of rat liver microsomal lipids was studied in rats treated with phenobarbital sodium (80 mg/day for 3 days). A 50% increase in liver microsomal lipid peroxidation *in vivo* as a response to intragastric administration of CCl_4 was observed. Pretreatment (30 min) of rats with SKF-525A (100 mg/kg) markedly reduced by 50% the liver microsomal lipid peroxidation elicited by CCl_4 poisoning. Malonic dialdehyde production in a microsome-supernatant system derived from rat liver was inhibited 35% by 0.10 mM SKF-525A and completely inhibited by 1.0 mM SKF-525A.

7921 HYDROXYLATION OF ALIPHATIC COMPOUNDS BY LIVER MICROSOMES: II. EFFECT OF PHENOBARBITAL INDUCTION IN RATS ON SPECIFIC ACTIVITY AND CYTOCHROME P-450 SUBSTRATE BINDING SPECTRA.

(E.) Frommer, U. (Biochem. Inst. U. Giessen, Germany), V. Ullrich and H. Staudinger. *Hoppe Seyler Z Physiol Chem* 351(8):913-918, 1970.

The phenobarbitol induction of the hydroxylation activity of rat liver microsomes was quantitated by a time course determination of the hydroxylation reaction with methylcyclohexane, 2-methylbutane, n-pentane, n-butane and isobutane. The isomeric alcohols were formed by identical non-linear kinetics. The specific activity was about the same for all substrates and was enhanced 4-5 fold by pretreatment of rats with phenobarbital; the binding of the substrates to cytochrome P-450 was increased similarly. 2,2-Dimethylpropane which only has primary CH- bonds was hydroxylated with the same specific activity as the other substrates having more reactive secondary and tertiary CH-bonds. The n-butane-induced difference spectrum was considerabl diminished by bubbling argon through the reaction mixture, indicating that substrate binding to cytochrome P-450 is reversible.

7922 NICKEL CARBONYL INHIBITION OF INDUCTION OF AMINOPYRINE DEMETHYLASE ACTIVITY IN LIVER AND LUNG.

(E.) Sunderman, F. W., Jr. (U. Connecticut Sch. Med., Hartford) and K. C. Leibman. *Cancer Res* 30(6):1645-1650, 1970.

The inhibition of hepatic aminopyrine demethylase basal activity and induced activity by nickel carbonyl $[Ni(CO)_4]$ was studied in rats. The maximum inhibition of hepatic aminopyrine demethylase occurred on the 2nd day after an injection of $Ni(CO)_4$ (2.2 mg Ni/100 g i.v.), and aminopyrine demethylase activity returned to normal levels by the 4th day after $Ni(CO)_4$. Administration of $Ni(CO)_4$ also inhibited hepatic aminopyrine demethylase activity in rats that had received daily injections of phenobarbital beginning 5 days before the Ni(CO)$_4$. However, in the phenobarbital-treated rats, maximum inhibition of hepatic aminopyrine demethylase did not occur until the 5th day after Ni(CO)$_4$ and aminopyrine demethylase activity did not return to normal levels until the 9th day after Ni(CO)$_4$. These experiments and other related studies indicate that Ni(CO)$_4$ inhibition of hepatic aminopyrine demethylase activity follows a distinctly different temporal sequence in noninduced and phenobarbital-treated rats. The mean activity of aminopyrine demethylase activity in rat lungs was increased 2 days after ingestion of phenothiazine. Exposure of rats to Ni(CO)$_4$ inhibited the phenothiazine induction of pulmonary aminopyrine demethylase activity.

SECRETION AND METABOLISM

Intestine

7982 PREPARATION AND PROPERTIES OF MUCOSAL EPITHELIAL CELLS ISOLATED FROM SMALL INTESTINE OF THE CHICKEN. *(E.)* Kimmich, G.A. (U. Rochester Sch. Med. Dent., N.Y.) *Biochemistry* 9(19):3659-3668, 1970.

A procedure was described for preparing suspensions of isolated intestinal epithelial cells in high yield and with good retention of morphological, metabolic, and transport properties. Photomicrographs showed the cells were structurally intact and retained the brush borders typical of intestinal cells *in vivo*. The isolated cells produced lactic acid and carbon dioxide from glucose at a linear rate for at least a 2-hr interval, and retained sensitivity to oligomycin and dinitrophenol, indicating normal energy conservation processes have been maintained. Galactose and valine were accumulated against concentration gradients by a process which was inhibited by dinitrophenol, ouabain, and oligomycin. Galactose transport was completely inhibited by phlorizin, but valine accumulation was unchanged or slightly stimulated. Once a metabolite has been accumulated, any of the inhibitors caused a discharge by the cells which proceeded until the concentration in the intracellular space was equal to that in the bathing medium. At substrate concentrations of 1.25 mM, gradients from 4- to 8-fold were normally generated; gradients of 30-fold were produced at lower substrate levels. K_m for galactose and valine are 2.5 and 4.2 mM, resp., in good agreement with values reported for everted sacs, but V_{max} was significantly higher than data reported for sacs.

7983 STUDIES ON INTESTINAL ANTIBODIES: I. ANTIBODY DESTROYING EFFECT OF INTESTINAL JUICE AND ITS ELIMINATION. *(Ger.)* Sonntag, H. G. (Hyg. Inst. U. Kiel. Germany), J. Fullhaas and W. Muller-Ruchholtz. *Z Immunitaetsforsch* 140(1):94-104, 1970.

Mouse intestine perfusates were tested for their destructive effect on agglutinating antibodies agains *S. Typhimurium* in the presence and absence of a proteinase inhibitor (trasylol). The destructive effect was inhibited for 3-4 hr by both *in vitro* or *in vivo* treatment with trasylol, whereby combined (i.v. and p.o.) administration of 280,000 units/kg turned out to be the most effective. Intestinal antibodies of orally immunized mice revealed a 10-fold increase following *in vivo* treatment with proteinase inhibitor An *in vivo* inhibition of antibody degradation by the intestinal proteolytic enzymes may be possible.

7984 CULTURES OF SEGMENTS OF HUMAN FETAL INTESTINE: APPLICATIONS TO CYTOLOGIC AND VIROLOGIC INVESTIGATIONS. *(E.)* Mitus, A. (Harvard Med. Sch., Boston, Mass), J. Folkman, J. F. Enders and S. Driscoll. *Proc Soc Exp Biol Med* 134(3):800-806, 1970.

Organ cultures of human fetal intestine were established and the capacity of a variety of viruses to induce cytopathic changes in cells derived from this tissue was determined. The primary organ culture was characterized by easily distinguishable villi and blood vessels; progressive flattening and thinning of the intestinal segment occurred as cultivation was extended and was accompanied by shedding of dead cells into the media. Before the segments completely degenerated, a new population of cells, both fibroblastoid and epithelioid cells, became apparent adjacent to the cut edges, and spread rapidly along the glass rod and more slowly along the walls of the vessel. Smooth monolayers were established at these sites within 7-14 days after the beginning of migration. In contrast to the above proliferation, replication of lymphocytes did not occur in primary organ culture without phytohemagglutinin. The addition of several viruses (measles, herpes simplex, adenovirus I, cytomegalo, rubella, varicella-zoster) to the primary organ culture or the secondary monolayer outgrowth induced the characteristic cytopathic effects of the virus.

7985 DEMONSTRATION OF ANTIBODY IN RABBIT FECES AFTER ACTIVE OR PASSIVE PARENTERAL IMMUNIZATION. *(E.)* McCleery, J. L. (Dept. Med., U. Chicago, Ill.), S. C. Kraft and R. M. Rothberg. *Digestion* 3(4):213-221, 1970.

Specific antibody to bovine serum albumin (BSA) was measured in the feces, gastrointestinal contents, and serum of rabbits immunized either actively (i.v. or s.c. injection of crystallized BSA) or passively (i.v. injection of hyperimmune rabbit anti-BSA). Anti-BSA was detected in the feces of actively immunized rabbits and there was no correlation between the amount of circulating anti-BSA and that detected in the feces. Anti-BSA was also detected in the gastric, ileal, cecal and descending colon contents of two actively immunized rabbits. Fecal content of anti-BSA was lower in rabbits actively immunized s.c. than i.v. Serum anti-BSA levels occurred in 4 passively immunized rabbits 5 min after antibody injection and the disappearance curve of this circulating anti-BSA indicated a half-life of 5.0 days. Detectable amounts of anti-BSA occurred in the feces of 214 passively immunized rabbits 6-24 hr after passive antibody injection and in 314 rabbits by day 6 after injection. Circulating antibody to a soluble protein antigen seemingly does pass into the gastrointestinal lumen.

7986 METABOLIC ASPECTS OF ISOLATED CELLS FROM RAT SMALL INTESTINAL EPITHELIUM. *(E.)* Iemhoff, W. G. J. (Rotterdam Med. Sch., Netherlands), J. W. O. Van Den Berg, A. M. De Pijper and W. C. Hulsmann. *Biochim Biophys Acta* 215(2):229-241, 1970.

Epithelial cells from the small intestine of the rat were isolated according to mechanical procedures as described by Sjöstrand and Harrison and Webster, resp., and the two methods compared with regard to yield and integrity of the cells obtained. While the cells in the suspension prepared by the method of Sjöstrand showed signs of appreciable morphological and biochemical damage, the cells harvested according to the principle of Harrison and Webster appeared essentially intact and displayed a glycolytic activity, in the absence of added cofactors, of the same order as intestinal mucosa *in situ*. The cells isolated by the second method were homogenized and the homogenate subjected to differential centrifugation, and a mitochondrial preparation was obtained which showed intact oxidative phosphorylation. The stimulation of respiration by the addition of ADP was small; ATPase activity, stimulated by Mg^{2+} or 2,4-dinitrophenol was present. Analysis of adenine nucleotide concentrations in intestinal mucosa revealed a high AMP+ADP to ATP concentration ratio, which may be the reason for the high rate of aerobic glycolysis of rat small intestinal epithelium.

7987 OSMOLALITY OF DUODENAL ASPIRATE FOLLOWING SECRETIN INFUSION IN MAN. *(E.)* Pascal, J. P. (Hosp. Purpan, Toulouse, France), R. Guiraud, N. Vayesse and D. Augier. *Digestion* 3(4):222-230, 1970.

7991 EFFECT OF COPROPHAGY PREVENTION AND ANTIBIOTICS ON CHOLINE DEGRADATION IN RATS.

(E.) Kwong, E. (Grad. Sch. Nutr., Cornell U., Ithaca, N.Y.) and R. H. Barnes. *J Nutr* 100(7): 711-714, 1970.

The relative effectiveness or prevention of coprophagy in altering intestinal microflora was evaluated in rats by measuring the total trimethylamine in urine arising from intestinal microflora acting upon a test dose of choline given by gastric intubation. Preventing coprophagy lowered the urinary total trimethylamine by approximately 30%; dietary supplements of chlortetracycline or phthalylsulfathiazole reduced total trimethylamine slightly more effectively than coprophagy prevention. A combination of chlortetracycline and phthalylsulfathiazole was more effective (60%) in lowering trimethylamine than either compound alone. Penicillin alone had little or no effect upon choline degradation; however, a combination of penicillin and phthalylsulfathiazole showed remarkable synergistic effect for the inhibition of total trimethylamine excretion (83%), an effect greater than for any other treatment studied. Microbial degradation of choline in the rat probably takes place mostly in the lower part of the intestine but the extent of this degradation may be greatly modified by changes in the bacterial population of the upper intestinal tract.

7992 BACTERIAL HISTIDINE DECARBOXYLASE IN RAT STOMACH.

(E.) Beaven, M. A. (Natl. Heart Lung Inst., Natl. Inst. Hlth., Bethesda, Md.), Z. Horakova and W. B. Severs. *Europ J Pharmacol* 11(2):233-240, 1970.

One of two histidine decarboxylase activities found in rat stomach was present in the supernatant fraction of stomach homogenate, had optimum activity at pH 7 and appeared similar to the specific mammalian L-histidine decarboxylase (EC 4.1.1.22) described by other workers. The second, in the insoluble residue of stomach homogenate, had a pH optimum of 5 and resembled the *Lactobacillus* L-histidine decarboxylase (EC 4.1.1.22). This second, residue enzyme was located in the upper part of normal rat stomach, an area which supported a heavy growth of *Lactobacillus*. The residue histidine decarboxylase activity was absent in germ-free rat stomach and was therefore thought to be of bacterial origin. In view of the coprophagic activity of rats, feces could serve as an inoculum of *Lactobacillus* in stomach, and the levels of activity of the residue enzyme were found to be related to the state of cleanliness of the animal cages; other factors, such as starvation and drug treatment also affected levels of the residue enzyme. The histamine content of stomach appeared to be related in part to the activity of the residue histidine decarboxylase.

7993 EXPERIMENTAL MESENTERIC VENOGRAPHY.

(E.) Gyepes, M. T. (UCLA Sch. Med., Los Angeles, Calif.) and J. Rosch. *Invest Radiol* 5(4):257-260, 1970.

Transjugular mesenteric venography with obstruction of the superior mesenteric vein by a balloon catheter allowed excellent visualization of the mesenteric veins. The method was a combination of two techniques: first, a portacaval shunt was created by transhepatic puncture of the portal vein with a modified Ross needle which was introduced via the jugular vein. The puncture tract in the liver was then dilated by coaxial catheters and a large catheter was left in the portal vein. Thereafter a double-lumen balloon catheter was introduced through the transjugular catheter and was positioned in the superior mesenteric vein. By inflating the balloon, runoff into the liver was stopped temporarily, and contrast material was injected through the second lumen. Excellent visualization of the mesenteric venous bed was obtained consistently; visualization of the small venous branches was further enhanced by superselective catheterization.

7994 THE REACTION OF LIVER BLOOD FLOW DURING AN INCREASE IN LIVER OXYGEN CONSUMPTION.

(Ger.) Scholtholt, J. (Physiol. Inst. U. Dusseldorf, Germany). *Pflueger Arch* 318(3):202-216, 1970.

The effect of increased hepatic oxygen consumption on blood flow in the hepatic artery and portal vein was determined in anesthetized mongrel dogs; oxygen consumption was increased by portal infusion of casein hydrolysate (amino acids), and artificial respiration was used to maintain constant alveolar CO_2 pressure. The infusion increased the O_2 consumption/100 g liver from 1.99 ml/min to 3.88 ml/min, and accelerated the arterial hepatic blood flow from 19.8 to 34.4 ml/min/100 g. The portal vein flow rate increased 16% during infusion, and the oxygen fractio given off to the liver by this vessel increased from 2.57 to 3.72 ml O_2/min/100 g. The flow rate of both hepatic vessels was related to the metabolic activity and oxygen consumption by the liver.

7995 THE REACTION OF LIVER AND INTESTINAL BLOOD FLOW TO A GENERAL HYPOXIA, HYPOCAPNIA AND HYPERCAPNIA IN THE ANESTHETIZED DOG.

(Ger.) Scholtholt, J. (Physiol. Inst. U. Dusseldorf, Germany and T. Shiraishi. *Pflueger Arch* 318(3):185-201, 1970

Blood flow was determined in hepatic arteries and portal veins of 18 anesthetized dogs in which spontaneous breathing was blocked with succinyl choline and artificial respiration was maintained using various concentrations of oxygen and CO_2. Lowering the arterial oxygen pressure from 132 mm Hg to 44 mm Hg (hypoxia) did not affect blood flow in either vessel, since the observed increased resistance of the mesenteric vessels was compensated by increased perfusion pressure. Hypercapnia produced by elevating the arterial CO_2 pressure from 42 mm Hg to 65 mm Hg caused a 42.8% acceleration of the mesenteric blood flow an a 17.6% increase of the hepatic arterial flow. A direct relationship between CO_2 pressure and blood flow in hepatic arteries and in mesenteric vessels was postulated.

DIAGNOSTIC PROCEDURES

8003 INTRALUMINAL SMALL-INTESTINAL UTILIZATION OF d-XYLOSE BY BACTERIA: A LIMITATION OF THE d-XYLOSE ABSORPTION TEST. *(E.)* Goldstein, F. (Lankenau Hosp., Philadelphia, Pa.), S. Karacadag, C. W. Wirts and O. D. Kowlessar. *Gastroenterology* 59(3):380-386, 1970.

Poor correlation between tests of fat absorption and the *d*-xylose test was noted in patients with variants of the blind loop syndrome. In such patients manifesting inordinately low *d*-xylose urinary excretion, coliform bacteria were recovered from the upper small intestine which on *in vitro* incubation manifested the ability to utilize *d*-xylose for their own metabolism. Perfusion of the duodenum and about 1 ft of jejunum with 25 g of *d*-xylose was performed in 3 volunteers and in 1 suitably selected patient before and after the eradication of heavy coliform growth. Phenol red was used as a nonabsorbable marker during the perfusion studies. The results of the perfusion tests and the clinical correlations indicated that multigram quantities of xylose may disappear from the lumen of the small intestine in patients with excessive coliform growth, presumably because bacteria metabolize xylose as substrate for their own metabolism. In such patients urinary xylose measurements may lead to erroneously low estimates of xylose absorption.

8004 RETROGRADE PANCREATOGRAPHY AND CHOLANGIOGRAPHY BY FIBER DUODENOSCOPE. *(E.)* Takagi, K (Cancer Isnt. Hosp., Tokyo, Japan), S. Ikeda, Y. Nakagawa, N. Sakaguchi, T. Takahashi, K. Kumakura, M. Maruyama, N. Someya, H. Nakano, T. Takada, T. Takekoshi and T. Kin. *Gastroenterology* 59(3):445-452, 1970.

Simultaneous pancreatography and cholangiography after cannulation of the ampulla of Vater was performed on patients with choledocholithiasis, diagnosed by retrograde cholangiography. A fiber duodenoscope was inserted under direct vision into the descending part of the duodenum of patients under general anesthesia. The ampulla of Vater was observed in 4 of 7 patients and cannulation of the ampulla was successful in 2 cases. Cholangiography was performed along with pancreatography by the infusion of 60% urografin. The relation of the formation of a common channel between the common bile and pancreatic ducts and changes in the ampulla of Vater caused by disease were studied radiographically by the cannulation of the ampulla of Vater. Serum amylase level increased abruptly (from 105 to 2890 Smith Roe units the 1st day after pancreatography) but returned to the normal level within 1 week in the subject whose entire pancreas was visualized by radiography.

8005 THE ASHING TECHNIQUE AS A MORE PRECISE METHOD FOR THE RADIOASSAY OF ^{51}Cr IN FECES. *(E.)* Kuiper, D. H. (Coll. Human Med., Michigan St. U., East Lansing), D. J. Fall and H. M. Pollard. *J Nucl Med* 11(9):527-529, 1970.

Two methods for the radioassay of stool for blood loss using ^{51}Cr tagged erythrocytes were compared. One method assayed a sample of the 24-hr stool homogenate, while the other method assayed the ash of the entire 24-hr fecal collection. The ashing technique revealed better precision in recovery as shown by standard deviation of 3.0 as compared to a standard deviation of 32.0 using the wet technique. The ashing method concentrates a large volume of stool, thereby yielding higher counts per sample and thus reducing the error in counting.

8006 AN IMPROVED COMPRESSED AIR APPARATUS FOR EXFOLIATIVE CYTOLOGY OF THE STOMACH. *(E.)* Wenger, J. (VA Hosp., Atlanta, Ga.) and E. Penfold. *Gastroenterology* 59(3):358-363, 1970.

Exfoliative cytology of the stomach was simplified by a collection method which used a compressed air apparatus to deliver 300 ml of fluid to the gastric mucosa in 15 to 30 sec with a pressure of 15 to 20 psi; retrieval of the fluid was accomplished within 30 to 60 sec with slight negative pressure. The mucosa was lavaged 8 to 12 times within a period of 10 to 12 min while the patient was seated comfortabl The test can be performed by technicians instructed in gastric intubation techniques but without cytolog training. No adverse reactions followed the use of this method in more than 500 tests; its simplicity results in greater use of gastric exfoliative cytology without loss of diagnostic accuracy.

8007 THE SPECIFICITY OF SERUM IMMUNOGLOBULIN LEVELS IN THE DIAGNOSIS OF ACUTE HEPATITIS COMPARED WITH OTHER BIOCHEMICAL RESULTS. *(Ger.)* Kindler, U. (1st Med. Clin. U. Dusseldorf, Germany) and D. Koch. *Deutsch Med Wschr* 95(28):1483-1486, 1970.

The specific behavior of immunoglobulin in hepatitis was investigated in 47 patients with hepatitis by comparison of the results with other laboratory findings. The following determinations were made at the same time: total bilirubin; serum transaminase; total protein and paper-electrophoretic serum protei fractionation. IgG, IgA and IgM (measured by radial immunodiffusion) were of little diagnostic value and could not replace determination of transaminase and bilirubin levels in serum. There was no definit correlation between immunoglobulin content and pape electrophoretic serum protein fractionation. Nonetheless, the latter gave similar results as immunoglobulin in the evaluation of the course of hepatiti

8008 ANGIOSCANOGRAPHY IN MALIGNANCY. *(E.)* Katsube, Y. (Tottori U. Sch. Med., Japan) H. Ishikawa, M. Shishido and M. Shimizu. *Yonago Ac Med* 14(1):33-39, 1970.

A technique of positive scanning or angioscanograph employing injections of ^{131}I-macroaggregated albumi into the artery through the same catheter used in arteriography was used in 43 patients with proven malignancy (including liver and pancreatic tumors). With this method, high concentrations of ^{131}I-macroaggregated albumin corresponded to neovascularity associated with neoplasms on arteriograms. Clinical results showed that arteriography and angioscanography diagnosed diseases in 28 of 43 patients on day 1 of scanning. On day 2 of testing, only 6 malignancies were diagnosed by arteriography alone, while on day 3, 4 malignancies were observed by angioscanography alone. Five cases were not diagnosed on day 4 by either method. Angioscanography, when combined with selective arteriography would appear to be valuable in evaluation of malignancy.

8009 COMPUTED NORMAL VALUES FOR PEAK ACID OUTPUT BASED ON AGE, SEX, AND WEIGHT. *(E.)* Martin, H. F. (Rhode Island Hosp., Providence), A. H. Blackman, D. L. Lambert and W. R. Thayer. *Amer J Dig Dis* 15(9):783-789, 1970.

A table of computed normal ranges for histamine acid phosphate stimulated peak acid output was constructed by deriving an empirical equation for peak acid output according to age, sex and weight, utilizing previous data on gastric acid output available in the literature. The reliability of this table was substantiated by results of the peak acid output obtained in 64 patients (54 males and 10 females) with proven duodenal ulcer and in 38 normal subjects (26 males and 12 females). When compared to the computed normal values based on sex, age and body weight, 90% of patients with duodenal ulcers fell outside the expected normal range and 92% of the normal subjects fell within the computed normal range. This does not mean that everyone outside the expected normal has a duodenal ulcer but it suggests that the individual may be a potential candidate for development of ulcer disease.

8010 CORRELATION OF MEASURED VOLUME WITH RADIOLOGIC APPEARANCE OF INTESTINAL GAS IN NORMAL SUBJECTS. *(E.)* Wittenberg, J. (Boston U. Sch. Med., Mass.) and M. D. Levitt. *Invest Radiol* 5(4):244-249, 1970.

Measurements of the volume of intestinal gas by a washout technique in 9 normal subjects were correlated with the appearance of this gas on abdominal roentgenograms. The total volume of intestinal gas ranged from a low of 30 ml to a high of 199 ml with an average of 86 ml. Three experienced radiologists, after being shown the roentgenograms of subjects with high (199 ml), medium (70 ml), and low (30 ml) quantities of gas and informed of the measured volume of gas for each of these 3 subjects, estimated the gas volume of the remaining 6 subjects with errors of 9, 18 and 20%, resp. The ability to evaluate semiquantitatively normal gas volumes can probably be achieved with a minimum of training by experienced radiologists.

8011 SCANNING ELECTRON MICROSCOPY: A NEW METHOD IN THE STUDY OF RECTAL MUCOSA. *(E.)* Kavin, H. (U. Witwatersrand Med. Sch., Johannesburg, Union of South Africa), D. G. Hamilton, R. E. Greasley, J. D. Eckert and G. Zuidema. *Gastroenterology* 59(3):426-432, 1970.

The use of the scanning electron microscope in studying the surface structure of the rectum was described. The surface of normal rectal mucosa presented a remarkably neat and geometrical pattern comprising numerous polygonal units, each with a central crypt surrounded by epithelial cells and goblet cells; the units were delineated by shallow furrows. The rectal mucosal surface of patients with chronic ulcerative colitis in remission was distorted by irregular corrugations probably due to bands of irregularly regenerating epithelial cells. The hemispherical projections corresponding to the surfaces of columnar epithelial cells or goblet cells were not evident, but the surface appeared irregular and flattened. Scanning electron microscopy may be a valuable additional tool in the investigation of the surface pathology of the rectal mucous membrane.

8012 LOCALIZATION OF RECORDING SITE IN THE ESOPHAGUS BY MEANS OF CARDIAC ARTIFACTS. *(E.)* Trop, D. (Acad. Hosp. St. Rafael, Louven, Belgium), R. Peeters and K. P. Woestijne. *J Appl Physiol* 29(3):283-287, 1970.

The modifications of esophageal pressure (recorded by a balloon system) caused by cardiac oscillation were mapped and found to have a typical morphology at every level of the esophagus. Comparison of these artifacts at different esophageal heights and various respiratory levels, demonstrated that pressure was recorded at the top of the long balloon, in the sitting position, when there was a continuous pressure gradient in the esophagus. However, when the top of the balloon was located in a region of the esophagus with a more positive pressure than at a next lower level, the pressure and the artifact was recorded at that lower level. Shifts of the pressure recording site inside the long balloon were particularly frequent in the supine position. The better reproducibility of the lung compliance value at different levels in the esophagus, observed with the long balloon, was a consequence of these shifts in pressure recording site; similar shifts occurred depending on the state of inflation of the lungs. The regular sequence of the cardiac artifacts along the esophagus allows for comparison between regionally equivalent pressures in different individuals.

8013 ROENTGEN AND RADIOACTIVE ISOTOPE INVESTIGATION IN SUBDIAPHRAGMATIC LIVER ECHINOCOCCOSIS. *(Rus.)* Deineka, I. Ya. (Pirogoy Med. Inst., Odessa, USSR), E. D. Dubovyi and V. V. Demidas. *Klin Khir* (2):27-32, 1970.

GASTROINTESTINAL DISEASES

ESOPHAGUS

8055 CONTROLLED PRODUCTION OF ACUTE ESOPHAGITIS: EXPERIMENTAL ANIMAL MODEL. *(E.)* Goldberg, H. I. (U. California San Francisco Med. Ctr.), W. J. Dodds, C. Montgomery, S. A. Baskin, F. F. Zboralske. *Invest Radiol* 5(4):254-256, 1970.

The reproducibility of esophagitis severity and depth of injury for different acid-pepsin infusion times were investigated in unanesthetized, adult cats. The depth of esophageal injury was limited to the mucosa and was accompanied by some epithelial erosion and edema in all 9 cats which received a 1 hr infusion and only 1 of these animals had complete erosion of the epithelium. The depth of injury extended into the submucosa accompanied by complete epithelial erosion and proteolytic changes in 4 of 11 animals which received a 2 hr infusion. Of 7 cats with injury confined to the mucosa, 6 had complete epithelial erosion. No significant difference in the severity of the esophagitis existed between animals infused with the acid-pepsin solution for 1 hr and animals infused with the acid-pepsin solution for 1 hr and 3 additional hr with saline solution, whereas a significant difference was seen between animals infused for 4 hr with the acid-pepsin solution and the group infused for 1 hr with the acid-pepsin solution and for 3 additional hr with saline solution. The depth of esophageal injury can be determined reliably by selection of the appropriate infusion time.

STOMACH AND DUODENUM

8086 ADENOCARCINOMA OF GLANDULAR STOMACH AND DUODENUM IN WISTAR RATS INGESTING N-METHYL-N'-NITRO-N-NITROSOGUANIDINE, HISTOPATHOLOGY AND ASSOCIATED SECRETORY CHANGES. *(E.)* Bralow, S. P. (Jefferson Med. Coll., Philadelphia, Pa.), M. Gruenstein, D. R. Meranze, A. Bonakdarpour and M. B. Shimkin. *Cancer Res* 30(5):1215-1222, 1970.

Histopathology and secretory changes associated with adenocarcinoma of glandular stomach and duodenum in rats given N-methyl-N'-nitro-N-nitrosoguanidine (in drinking water at a concentration of 83 mg/l) were investigated. After 3 days of treatment, microcysts in the antral and fundal areas and submucosal edema and fibrosis of the basal portion of the mucosa were observed. By the 41st week, mucosal atrophy was marked and occurred predominantly in the pyloroduodenal areas. Multiple superficial ulcerations were found in the antrum and to a lesser degree in the mucosa of the body with great numbers of microcysts and occasional patches of intestinalization and glandular atypism. Tumors were found in 80% of the animals by the 52nd week, 75% of which were adenocarcinomatous lesions of the antrum or duodenum which were either ulcerating, nodular, or polypoid. The volume of gastric secretion and titratable acidity remained at control levels (% of control: range 80-110%) until late (52 weeks) in the course of mucosal atrophy and cancer development. Pepsin concentration and secretion increased (19% and 41%) from day 3, but gradually returned to control levels by the end of the year of carcinogen exposure. N-methyl-N'-nitro-N-nitrosoguanidine appears to be highly suitable for use in experimental models studying gastric carcinogenesis because of the high frequency of tumor formation and minimal toxicity associated with it.

8087 AN ENZYME HISTOCHEMICAL CLASSIFICATION OF GASTRIC CARCINOMA AND ITS SIGNIFICANCE IN PROGNOSIS. *(E.)* Kawashima, T. (Okayama U. Med. Sch., Japan), T. Ogata, T. Matsumoto, F. Murata, H. Tsuda and S. Tanaka. *Gann* 61(4):299-310, 1970.

The activity patterns of aminopeptidase, β-esterase, succinic dehydrogenase and glucose-6-phosphate dehydrogenase in gastric cancers were used to classify the cansers into 7 types. Based on the histochemical findings, a new classification of gastric carcinoma was proposed, and this classification revealed a close correlation between the enzymic pattern and the mode of spreading of the cancer; a correlation in the prognosis of the cancer and the enzymic pattern classification was observed.

8088 PRODUCTION OF TUMORS IN GLANDULAR STOMACH OF HAMSTERS BY N-METHYL-N'-NITRO-N-NITROSOGUANIDINE. *(E.)* Fujimura, S. (Natl. Cancer Ctr., Res. Inst., Tokyo, Japan), K. Kogure, S. Oboshi and T. Sugimura. *Cancer Res* 30(5):1444-1448, 1970.

The gross and histological findings in hamsters administered N-methyl-N'-nitro-N-nitrosoguanidine in drinking water (83 μg/ml) for 6 months or longer were described. Twenty fibrosarcomas in the glandular stomach and 3 adenocarcinomas and 2 fibrosarcomas in the duodenum were observed in animals that died after 6 to 10 months. Almost all the tumors in the glandular stomach were located at the pylorus region; these tumors grew roughly in the mucosa and some almost obstructed the whole cavity of the glandular stomach or infiltrated to adjacent organs. In almost all the cases of fibrosarcomas in the glandular stomach, atypical glandular epithelial proliferation infiltrating into submucosa or muscle layer was also present; no metastasis was found. Adenosarcomas in the duodenum were poor in cellular atypia, but infiltrated the muscle layer and the serosa.

8089 EFFECTS OF ANTRECTOMY ON THE FUNDIC MUCOSA OF THE RAT. *(E.)* Macleod, I. B. (U. Med. Sch., Edinburgh, Scotland), F. Martin and W. Sircus. *Gastroenterology* 59(3):437-444, 1970.

In order to elucidate the relation between antral gastrin and acid and pepsin secretion, antrectomy followed by gastroduodenostomy was performed on 45 adult femal rats, and the size of the gastric mucosa and parietal and peptic cell populations were measured 6 and 9 weeks after operation, and the results were compared with the observations made on matched controls. In addition to an over-all reduction in the size of the fundic mucosa after antrectomy and the consequent reduction in the total cell populations, a reduction in the secretory cell densities was observed. Other morphological changes included mononuclear infiltration and flattening of the mucosa indicative of atrophic gastritis. The slightly more marked changes observed 9 weeks postantrectomy when compared with 6 weeks suggest a progressive phenomenon. The experiments establish a useful experimental model for the production of gastric mucosal hypoplasia.

8090 EFFECT OF ETHANOL ON THE GASTRIC MUCOSA OF THE HEIDENHAIN POUCH OF DOGS. *(E.)* Dinoso, V. P. (Temple U.Hlth. Sci. Ctr., Philadelphia, Pa.), W. Y. Chey, H. Siplet and S. H. Lorber. *Amer J Dig Dis* 15(9):809-817, 1970.

The effect of ethanol on the mucosa of the Heidenhain pouch in dogs was studied by instilling ethanol in concentrations of 10, 20 and 40% using changes in ionic fluxes of an acid solution and mucosal alterations to measure the effects of ethanol. The instillation of 20 or 40% ethanol resulted in increased insorption of H+ and increased exorption of Na+ into the pouch lumen. Following the administration of 20 and 40% ethanol, the mucous layer and mucin content of the lining epithelial cells decreased markedly. The surface of epithelial cells appeared swollen and areas of cellular exfoliation were observed. Hourly bathing with the acid test solution (30 min at hourly intervals for 5 hr) aggravated the injury and induced bleeding, but hourly instillation of a phosphate buffer solution minimized the damage. Ionic fluxes returned to pre-ethanol levels 2 hr after 20% ethanol and 3-4 hr after 40% ethanol. Partial restoration of mucosal damage occurred in 4-6 hr and was complete in 24 hr.

8091 MYELIN FIGURES IN CHRONIC GASTRITIS OBSERVED BY ELECTRON MICROSCOPE. *(Ger.)* Otto, H. F. (Path. Inst. U. Hamburg, Germany). *Beitr Path Anat* 140(4):407-418, 1970.

Myelin figures noted in many forms of cellular pathology were described in gastric mucosal cells obtained from biopsy material of 19 patients with chronic gastritis of various severity. The myelin figures were present in peptic, acid and enterochromaffin cells, as well as in chronic inflammatory cells of the tunica propria. Myelin figures in mitochondrial membranes and cristae suggested that these figures may have originated from damaged mitochondria, especially since signs of cytoplasmic damage were rarely seen. The myelin figures may possibly be caused by impairment of oxidative processes.

STOMACH AND DUODENUM

Peptic Ulcers

8131 MUCOSAL SUSCEPTIBILITY IN PEPTIC ULCERATION: A METHOD FOR TESTING. *(E.)* LeVeen, H. H. (St. U. New York Downstate Med. Ctr., Brooklyn), G. Falk, H. O. Douglass, Jr. and L. J. Spingola. *Proc Soc Exp Biol Med* 134(3):793-796, 1970.

In the presence of induced (histamine, 1 mg in beeswax daily) gastric hypersecretion of a magnitude insufficient to produce an ulcer, factors (androgenic nitrogen retaining anabolic agents) which lower mucosal resistance to peptic digestion were investigated. Addition of hydrocortisone to the histamine regimen raised the mortality due to duodenal ulcer perforation from 16 to 59%; 13 of 22 guinea pigs died of this cause in an average of 6 days. Disruption of the stomach wall caused the deaths of 6 histamine and 6 histamine-hydrocortisone treated animals, with lesions involving a ragged linear rupture of a long segment (more than 1/2) of the gastric wall. Addition of an anabolic injectable agent to the regimen had an unfavorable effect on survival (100% died, 53% of perforated duodenal ulcer in an average time of 6.3 days). Of the 60 guinea pigs treated with anabolic agents, there were only 6 deaths due to fundic disruption, whereas 4 of 17 guinea pigs treated with histamine-cortisone without anabolic agents died of this cause.

8132 EFFECTS OF BENZYDAMINE ON EXPERIMENTAL GASTRIC ULCERS PRODUCED BY INDOMETHACIN AND RESERPINE. *(E.)* Burberi, S. (Fac. Pharm., U. Rome, Italy), V. Cioli and D. Piccinelli. *Pharmacol Res Commun* 2(2):91-95, 1970.

The effect of benzydamine (p.o.) on gastric ulcers experimentally induced in rats by indomethacin (12.5 mg/kg s.c.) and reserpine (5 mg/kg i.p.) was studied. Spontaneous lesions occurred in 9.3% of the animals whereas indomethacin caused lesions in 52%; benzydamine (100 mg/kg) reduced this to 26.6% in one study, and spontaneous lesions in 26.6% of the animals and indomethacin-induced lesions in 67% dropped to 29% with benzydamine (50 mg/kg) in a second study. The spontaneous incidence of 7% and the reserpine-induced ulcers (67%) in a third study was lowered to 40% by benzydamine (100 mg/kg). Benzydamine (50-100 mg/kg) possesses no ulcerogenic action in rats when administered alone, but when administered with indomethacin or reserpine has a significant anti-ulcer effect.

8142 GAS IN THE PORTAL VEIN OF ADULTS WITH NECROTIZING ENTEROPATHY. *(E.)* Berne, T. V. (U. Southern California Sch. Med., Los Angeles), H. I. Meyers and A. J. Donovan. *Amer J Surg* 120(2): 203-209, 1970.

The radiological detection of gas in the portal vein of 12 adults with necrotizing enteropathy which principally involved the small intestine was reported. Demonstrable mesenteric vascular occlusion was not present in any patient. Three patients survived, 2 with enteric necrosis which was not panmural and one with panmural necrosis. In the majority of these patients, the necrotizing enteropathy was probably consequent to impaired splanchnic blood flow with enteric ischemia. A primary necrotizing enteropathy could not be excluded in a few of these patients. Usually gas in the hepatic portal venous system is indicative of intestinal necrosis and demands prompt operative treatment.

Regional Enteritis

156 MICRODIVERTICULA AND SUBMUCOSAL EPI-
THELIAL ELEMENTS IN ULCERATIVE AND
RANULOMATOUS DISEASES OF THE ILEUM AND COLON.
E.) Clark, R. M. (Oshawa Gen. Hosp., Ontario,
anada). *Canad Med Ass J* 103(1):24-28, 1970.

ections of the segments of bowel received from
7 cases of regional enteritis and 16 cases of
lcerative colitis were re-examined for the
resence of microdiverticula and submucosal epi-
nelial elements. These structures were present
n 5 cases of regional enteritis and in 14 of ul-
erative colitis. A granulomatous type of inflamma-
ory response was found in the bowel and lymph nodes
n 14 of the 17 cases of regional enteritis, and in
one of the cases diagnosed as ulcerative colitis.
n spite of this, difficulty was experienced in
lacing some cases in one or the other diagnostic
ategory suggesting that the two conditions may not
e etiologically discrete, and that both may be, in
act, related to the presence of microdiverticula.
n addition, it may be that colitis cystica pro-
unda is a result of microdiverticulosis in which
ne submucosal glandular structures attain unusually
arge proportions.

157 AGENT TRANSMISSIBLE FROM CROHN'S DISEASE
TISSUE. *(E.)* Mitchell, D.N. (Brompton
osp., London, England) and R.J.W. Rees. *Lancet*
(7665):168-171, 1970.

n attempt to transmit Crohn's disease by inocula-
ion of homogenates from Crohn gut or lymph-node
issue and from non-Crohn lymph-node into the foot-
ads of normal and immunologically deficient mice
as reported. A significant proportion of the
ootpads of mice receiving homogenates prepared
rom Crohn's disease tissues showed the histologi-
al characteristics typical of the focal granulomas
f Crohn's disease in man 6-24 months after inocu-
ation. Conversely, the early inflammatory reactions
een in a small proportion of the footpads of mice
noculated with non-Crohn's homogenates could no
onger be seen in the late examination. Positive
veim tests were found in 30% of the mice given
omogenates from Crohn's disease tissues and all
ere associated with granulomas in the footpads,
ut all Kveim tests were negative in mice given
on-Crohn's homogenates.

SMALL INTESTINE

Malabsorption

8165 IMMUNOCHEMICAL STUDIES OF THE SERUM, INTESTINAL SECRETIONS AND INTESTINAL MUCOSA IN PATIENTS WITH ADULT CELIAC DISEASE AND OTHER FORMS OF THE CELIAC SYNDROME. *(E.)* Douglas, A. P. (Massachusetts Gen. Hosp., Boston), P. A. Crabbe and J. R. Hobbs. *Gastroenterology* 59(3):414-425, 1970.

The densities of immunoglobulin-containing plasma cells in the intestinal tract in relation to the concentrations of immunoglobulins in serum, intestinal secretions, and bone marrow were investigated in a group of patients with adult celiac disease (treated and untreated) and compared with values observed in normal subjects and in patients with abnormalities of the small intestinal mucosa due to tropical sprue, Whipple's disease, and dermatitis herpetiformis and in subjects with normal intestinal mucosa but with low serum levels of either IgA or IgM. In the majority of jejunal mucosal specimens plasma cells of the IgA class were the predominant variety and IgA was the predominant immunoglobulin found in jejunal juice and saliva. Celiac patients differed from the norm, however, in having increased values for the population densities of the IgM plasma cells in jejunal mucosa (normal 50, celiac 105-244 mg/ml), even those with low levels of serum IgM; this was paralleled by an increase in the concentration of IgM in jejunal juice. However, salivary IgM concentration was normal in these patients and the proportion of IgM cells was normal in the rectal mucosa and reduced in the bone marrow. In several celiac patients (who did not have IgA deficiency) the predominant immunocyte in the jejunal mucosa was of the IgM class. The population densities of IgM plasma cells returned toward normal with prolonged gluten restriction. Increased density of IgM immunocytes was not found in patients with tropical sprue, dermatitis herpetiformis or Whipple's disease; in subjects with low serum IgA or IgM, the jejunal mucosa was rich in IgM or IgA, resp.

8166 INTESTINAL ABSORPTION OF TWO DIPEPTIDES IN HARTNUP DISEASE. *(E.)* Asatoor, A. M. (Westminster Med. Sch., London, England), B. Cheng, K. D. G. Edwards, A. F. Lant, D. M. Matthews, M. D. Milne, F. Navab and A. J. Richards. *Gut* 11(5):380-387, 1970.

Oral tolerance tests of 2 dipeptides and of their constituent amino acids were compared in normal subjects and in a case of Hartnup disease. The rate of absorption of phenylalanine from phenylalanylphenylalanine and of tryptophan from glycyl-tryptophan was slower than after the equivalent amount of the free amino acids in the normal subjects, whereas absorption of the two essential amino acids (tryptophan and phenylalanine) in the patient was almost zero after administration in the free form, but was much greater after the dipeptide (the dipeptides themselves were not detected in the serum of the normal subjects or of the patient). Absorption of tryptophan and phenylalanine as the free acids was greater than from the 2 dipeptides in the rat small intestine, and peptidase activity was higher in the intestinal mucosal cells than in the lumen. Normal subjects apparently absorb essential amino acids by a dual mechanism of mucosal uptake of free amino acids and oligopeptides, whereas nutrition in Hartnup disease is largely dependent on uptake of oligopeptides containing the amino acids affected by the intestinal transport defect of the disease.

8167 STUDIES ON INFANT DIARRHEA: IV. SUGAR TRANSIT AND ABSORPTION IN SMALL INTESTINE AFTER A FEEDING. *(E.)* Rodriguez-de-Curet, H. (U. Puerto Rico Sch. Med., San Juan), C. Lugo-de-Rivera and R. Torres-Pinedo. *Gastroenterology* 59(3):396-403, 1970.

Sugar transport and absorption were studied in 22 infants with acute diarrhea by intubation and collection of intestinal contents after ingestion of a mixture containing either 0.4 M glucose, 0.4 M fructose, 0.2 M lactose, or 0.2 M maltose. Delay in gastric emptying, increase in transit time in the intestinal segment studied, significant malabsorption of the four sugars with minimal impairment for glucose and maximal for lactose absorption, and a definite impairment of lactose hydrolysis were observed. The finding of malabsorption for sugars in the presence of increased transit time suggests that alterations of transport processes and/or of the permeability characteristics of the small intestinal mucosa are probably the most important factors in the pathogenesis of acute diarrhea in infants. The finding of better absorption for glucose as compared with fructose suggests that permeability is altered to a greater degree than are the transport processes.

8168 FAT AND GLUCOSE MALABSORPTION AFTER HYPERTONIC MANNITOL. *(E.)* Nasrallah, S. M. (Johns Hopkins Sch. Med., Baltimore, Md.), S. Margolis and F. L. Iber. *Johns Hopkins Med J* 127 (1):38-45, 1970.

The effects of perfusion with hypertonic mannitol (10%) on the absorption of a ^{14}C-labeled triolein emulsion (2 μC in a 2 ml solution instilled into the intestine over a 5 min period) and of glucose (5 mg in a 2 ml solution) were studied *in vivo* in rat isolated jejunal loops. An average of 82% of the administered neutral fat was absorbed in the control (saline perfusion) rats as opposed to only 48% in the mannitol-perfused rats and 33% of the administered triolein was recovered as di- and triglycerides after mannitol perfusion (indicating an impairment in lipolysis) compared to 8% in control rats. There was a significantly greater amount of unabsorbed fatty acid and monoglyceride in the mannitol-treated rats. An average of 89% of the administered glucose dose was absorbed in saline-perfused rats and only 32% in hypertonic mannitol-perfused rats. Reduction in triolein and glucose absorption associated with hypertonic mannitol was accompanied by injury to intestinal tissue characterized by blunt short villi, epithelial cells lacking polarity, and necrosis at the tips of the villi. When hypertonic mannitol-treated rats were studied 7 days after cessation of hypertonic manitol treatment both intestinal absorptive capacity and the histolo-

ogical appearance of intestinal tissue returned to
ormal.

LARGE INTESTINE

180 ACUTE REGIONAL COLITIS - ISCHEMIC COLITIS? *(Ger.)* Egger, G. (Central Middlesex Hosp., ondon, England) and T. D. Kellock. *Scweiz Med Wschr* 0(29):1264-1272, 1970.

e symptomatology of non-necrotizing ischemic colis has been described in a retrospective study of cases of regional colitis (4 men, 12 women with mean age of 60 yr). The specific history was sually between 6 hr and 30 days before hospital admission when the following symptoms were recorded: abdominal pain (all patients), anal bleeding (13), diarrhea (8), nausea and vomiting (6), palpable tumor (2), and relapse of a previous similar attack (2). Segmental colonic lesions were demonstrated roentgenologically or by surgery in all cases. The course of the disease permitted conservative treatment (fluids, electrolytes, diet) in 6 patients, exploratory laparotomy in 6 patients with an ileostomy in 1 of them and a resection 5 yr later. Of the remaining 4 patients, 1 died of oliguria and uremia after a colostomy, 1 had a unilateral resection, and in the remaining 2 patients, segment resections and subsequent re-anastomoses were performed following ileostomy or colostomy. A large number of cases of non-necrotizing ischemic colitis can be diagnosed on the basis of characteristic clinical manifestations, in combination with contrast enemas.

LARGE INTESTINE

Ulcerative Colitis

8211 ULCERATIVE COLITIS. *(Ger.)* Widmaier, F. (Med. Clin. Stuttgart, Germany) and K. Heinkel. *Z Gastroent* 8(4):208-216, 1970.

Ninety-three patients (51 men, 42 women) with ulcerative colitis were treated and observed over a period of 12 years. The disease manifested itself in 32 patients at age 21-30; in 65 patients before age 40 and in 3 patients after age 50. The diagnosis was confirmed by radiology, by endoscopy, with or without histological proof of rectal biopsy material, and by radiology and endoscopy combined, with or without histology. Twelve patients were operated on after the diagnosis had been confirmed macroscopically and microscopically. The most frequent forms of localization were proctitis and colitis (left) with involvement of the rectum, sigmoid- and descending colon. Of 68 complications, hemorrhoids with typical proctoscopic findings were in the foreground (47%), and almost equally frequent were anal eczema, anal fissure and anal fistula (7% each); anal prolapse and periproctitic abscesses occurred rarely. Simultaneously occurring diseases of other organs were present in 71 patients (77%). Five of the 93 patients died (2 of the deceased were from the operated group of 12). The occurrence of relapse during conservative therapy was 40-47%/yr during an observation period of 10 years, while in the operated group 1 relapse/yr was observed during the first 4 post-operative years.

8226 ISLET CELL TUMORS OF THE PANCREAS WITH PORTAL VARICES AND GASTROINTESTINAL HEMORRHAGE. *(E.)* Maclean, N. (Western Gen. Hosp., Edinburgh, Scotland), C. W. A. Falconer, I. E. W. Gilmour and J. N. Webb. *J Roy Coll Surg Edinb* 15(4):206-212, 1970.

Three cases of islet cell tumors were described as a syndrome of gastrointestinal hemorrhage and portal varices. In each case the tumor in the pancreas was at or in the hilum of the spleen and large tortuous veins were present in the upper abdomen. The recurrent gastrointestinal hemorrhage was not due to chronic peptic ulceration, although in 2 of the cases ingestion of aspirin may have been an additional factor in causing erosion of the mucosa. Increased venous flow and obstruction of the veins by the tumor were partially responsible for the venous dilatation, but the presence of a vaso-active agent may also contribute to these effects.

8227 PANCREATIC PATHOLOGY, CHEMICALLY DEFINED LIQUID DIETS AND BACTERIAL FLORA IN THE RAT. *(E.)* Geever, E. F. (Albert Einstein Coll. Med., Bronx, N. Y.), E. Seifter and S. M. Levenson. *Brit J Exp Path* 41(4):341-347, 1970.

A completely defined liquid diet fed to germfree and conventional rats from weanling to adult life resulted in the development of pancreatic lesions. In the germfree animals these lesions were reversible and disappeared in the majority of this group after 5-8½ months. The lesions were encountered after ingestion of the diet for 1 month and consisted of acinar atrophy with fibrosis which was largely replaced by stromal fat after 3½ months in the more vulnerable conventional rats. From 4 months of diet ingestion onward unusual focal metaplasia was observed in the pancreas of conventional animals. The metaplastic cells resembled hepatic or oxyphilic (oncocytic) epithelium and were believed to arise in the islets but the possiblity of acinar or ductal origin could not be eliminated. The pancreatic pathology of this study seemed to be related to the presence of bacterial flora since conventional animals were more susceptible.

Pancreatitis

8243 CHRONIC PANCREATIC ASCITES. *(E.)* Schaefer, J. W. (U. Kentucky Med. Ctr., Lexington), S. C. Schindler, D. Hull and W. O. Griffen, Jr. *Gastroenterology* 59(3):453-459, 1970.

The clinical syndrome of chronic pancreatic ascites was defined and previously reported cases were reviewed; 3 new cases were reported. These patients were chronic alcoholics who experienced intermittent abdominal pain followed by rapid weight loss and chronic ascites; diagnosis was confirmed by persistently elevated serum and ascitic fluid amylase. Upon surgical exploration chronic pancreatitis, usually complicated with a pseudocyst, was found. Leakage of pancreatic secretions into the peritoneal cavity was considered to be of major importance in the pathogenesis of the ascites. Internal drainage of the pseudocyst into the gastrointestinal tract was an effective form of therapy.

LIVER AND BILIARY TRACT

8262 FREE AMINO ACID PATTERN IN THE LIVER FROM THE PATIENTS WITH AMINO ACID DISORDERS OF AMINO ACID METABOLISM. *(E.)* Tada, K. (Tohoku U. Sch. Med., Sendai, Japan), T. Yoshida and T. Arakawa. *Tohoku J Exp Med* 101(3):223-226, 1970.

The free amino acid pattern in livers biopsied or autopsied from the patients with amino acid disorders and from several controls was investigated. A noticeable difference in free amino acid pattern between the liver and the serum was observed, with a marked elevation of non-essential amino acids including aspartic acid, glutamic acid, serine, glycine and alanine in the liver as compared to the serum. An accumulation of phenylalanine (33.7 mg/100 g) in phenylketonuria, of methionine and homocystine (5.51 and 5.64 mg/100 g) in homocystinuria, of cystathionine (21.4 mg/100 g) in cystathioninuria, of glycine (21.5 mg/100 g) in hyperglycinemia and of alanine (25.9 mg/100 g) in hyperalaninemia was found in the biopsied livers. The increase of the amino acid in the respective disorders was 2- or 3-fold higher in the liver than in blood, but in cystathioninuria and homocystinuria the concentrations of cystathionine or homocystine in blood (1.3 and 0.4 mg/100 ml, resp.) were much lower compared to the accumulation of the amino acid in the liver, probably due to a higher clearance of these specific amino acids by the kidney. Analysis of the free amino acid pattern in postmortem liver tissue showed higher values compared to biopsied tissue, perhaps due to partial autolysis of the tissue.

8263 THE BLOOD SUPPLY OF EXPERIMENTAL LIVER METASTASES: II. A MICROCIRCULATORY STUDY OF THE NORMAL AND TUMOR VESSELS OF THE LIVER WITH THE USE OF PERFUSED SILICONE RUBBER. *(E.)* Lien, W. M. (Boston U. Med. Ctr., Mass.) and N. B. Ackerman. *Surgery* 68(2):334-340, 1970.

The blood supply of implanted liver tumors in rats was studied 4 days after implantation by perfusion with a colored silicone rubber. The newly formed tumor vessels took the form of a plexus or ring, situated at the periphery of the tumor and were connected to branches of the hepatic artery. Portal vein branches came close to the tumor, ending abruptly but never participating in the formation of the plexus of tumor vessels. Shunting from the hepatic artery to the portal vein was observed; after hepatic artery ligation, in almost half of the animals, the tumor plexus circulation was filled by perfusion via the portal vein.

8264 GLUCOCORTICOID-INDUCED ALTERATION OF THE SURFACE MEMBRANE OF CULTURED HEPATOMA CELLS. *(E.)* Ballard, P. L. (Natl. Inst. Arthritis Metab. Dis., Natl. Inst. Hlth., Bethesda, Md.) and G. M. Tomkins. *J Cell Biol* 47(1):222-234, 1970.

The effects of glucocorticoids on the surface membrane of cultured hepatoma (Morris) cells were investigated and evaluated by changes in cell electrophoretic, antigenic, and adhesive properties. The alteration was assayed by the increased adhesiveness of induced cells for a glass surface. The induction process (dexamethasone, 10^{-7}M) had a lag period of about 3 hr and attained a plateau after 24-30 hr when 50-80% of the steroid-treated cells were firmly adhered; less than 10% of the untreated cells adhered under the same conditions. Induction was inhibited by actinomycin D and cycloheximide, and demonstrated both pH (optimum 7.5) and temperature (24-37.5°C) dependence and responded to changes in steroid concentration (half maximal adhesion at 4×10^{-9}M). The adhesiveness of preinduced cells (grown in the presence of dexamethasone) was not affected by inhibitors of RNA and protein synthesis, fluctuations of temperature and pH, and the presence or absence of the steroid. When the induction process was reversed by removal of steroid or addition of actinomycin D, preinduced adhesiveness was lost with a half-life of 13-24 hr, but in the presence of cycloheximide the loss was accelerated ($t_{1/2}$ 3-5.5 hr). Glucocorticoids appear to induce the biosynthesis of a protein which either modifies the cell surface or is incorporated into surface structures (structural protein).

8265 STUDIES ON THE MECHANISM OF TEMPLATE STABILITY: CYTOPLASMIC DNA-LIKE RNA IN HEPATOCELLULAR CARCINOMAS. *(E.)* Sladek, N. E. (Dept. Pharmacol., U. Minnesota, Minneapolis) and H. C. Pitot. *Cancer Res* 30(6):1598-1604, 1970.

The DNA-like RNA in the cytoplasm of the liver cell and in highly differentiated hepatocellular carcinomas in rats was investigated by radioactive compound labeling and electron microscopy. Administration of actinomycin D (500 μg/kg) to rats given inorganic $^{32}PO_4$ to label their RNA resulted in a marked decrease in the total labeling of cytoplasmic RNA within a 3 hr period. However, the ^{32}P-labeled nucleotide composition of the RNA labeled in the presence of actinomycin D *in vivo* was quite similar to that of rat liver DNA, rather than to ribosomal RNA. This DNA-like RNA appeared to be associated with both the rough endoplasmic reticulum and the free polysomes of liver, and was also present in both the rough endoplasmic reticulum and the free polysomes of Morris hepatomas 5123c and 7800, as well as the Reuber hepatoma H-35. The DNA-like RNA may be associated with or equal to the postulated stable RNA templates in liver and hepatoma cytoplasm.

8266 SERUM LIPOPROTEIN PATTERNS IN LIVER DISEASE. *(E.)* Papadopoulous, N. M. (Walter Reed Army Inst. Res., Washington, D.C.) and M. A. Charles. *Proc Soc Exp Biol Med* 134(3):797-799, 1970.

An agarose gel electrophoretic technique which clearly detects and sharply resolves serum lipoproteins was applied to the determination of serum lipoprotein patterns in liver diseases (8 patients with Laennec's cirrhosis, 8 with viral hepatitis, and 3 with primary biliary cirrhosis). The patterns obtained were characterized by the presence of beta-, the absence of pre-beta-, and a trace of alpha-lipoproteins in portal cirrhosis; the presence of beta-, pre-beta-, and alpha-lipoproteins in primary biliary cirrhosis; and a densely stained beta- and absence of pre-beta- and alpha-lipoproteins in viral hepatitis during the first week of the acute phase and the reappearance of pre-beta- and alpha-lipoproteins after 2 weeks in the recovering cases without complications. The capacity of the hepatocyte to form alpha- and pre-beta-lipoproteins seemingly is greatly diminished in parenchymal liver disease but not in obstructive liver disease.

8267 HEPATIC INVOLVEMENT IN JUVENILE RHEUMATOID ARTHRITIS. *(E.)* Schaller, J. (U. Washington Sch. Med., Seattle), B. Beckwith and R. J. Wedgwood. *J Pediat* 77(2):203-210, 1970.

Five children with rheumatoid arthritis, in whom the onset was before the age 6 years, had massive hepatomegaly with mild derangement of liver function studies (elevated serum levels of transaminases and bilirubin and bromsulphalein retention). Three patients were originally thought to have malignancy or infections, rather than juvenile rheumatoid arthritis while all patients had high spiking fevers and other systemic manifestations and hepatomegaly which occurred at or near the onset of disease and regressed with its remission. Hepatic histology, studied in 4 of 5 children, showed nonspecific periportal collections of inflammatory cells and hyperplasia of Kupffer cells (no child had evidence of progressive liver disease). Juvenile rheumatoid arthritis should be considered in the differential diagnosis of hepatomegaly in children, particularly if it is associated with high fever and other manifestations of the disease, such as arthritis, rheumatoid rash, splenomegaly, generalized lymphadenopathy, pleuritis and pericarditis.

8268 EFFECT OF PARTIAL HEPATECTOMY ON TUMOR INCIDENCE IN BALB/c MICE TREATED WITH URETHAN. *(E.)* Lane, M. (Baylor Coll. Med., Houston, Texas), A. Liebelt, J. Calvert and R. A. Liebelt. *Cancer Res* 30(6):1812-1816, 1970.

Urethan was administered (3 mg/g body weight i.p. on alternate days) to 8- to 10-week-old BALB/c/Ki male and female mice, both intact and following removal of approximately 30% or 70% of the liver. In operated mice, injections were begun 2 days after partial hepatectomy. An additonal group had 70% of the liver removed but did not receive urethan. The incidence of hepatoma was increased (41%) in urethan-treated mice subjected to 70% hepatectomy and not increased in animals in other experimental groups (4% in same conditions without urethan treatment). Mitotic indices (mitoses/1000 cells) of liver tissue, determined in groups of untreated male and female mice after 30% and 70% hepatectomy, were significantly influenced by amount of liver removed and sex of animals(27 and 2 in males and 1 and 9 in females, 48 hrs after surgery, respectively). The increased rate of proliferation of liver cells after hepatectomy may enhance the susceptibility of the liver to the carcinogenic action of urethan.

8269 ACUTE INTERMITTENT PORPHYRIA: INCREASED ALA-SYNTHETASE ACTIVITY DURING AN ACUTE ATTACK. *(E.)* Sweeney, V. P. (Vancouver Gen. Hosp., British Columbia, Canada), M. A. Pathak and A. K. Asbury. *Brain* 93(2):369-380, 1970.

Delta-amino-levulinic acid (ALA)-synthetase activity was correlated biochemically with aberrations of porphyrin metabolism in liver biopsy specimens obtained from a 29-yr-old man with fatal, acute intermittent porphyria. A 40-fold or more increase in activity of ALA synthetase, the rate controlling enzyme in porphyrin biosynthesis, was established and correlated with concomitant parameters of disordered porphyrin metabolism and the clinical pathological features. ALA-synthetase activity (nmole/hr/g) measured in a specimen taken at open biopsy during an acute attack was markedly increased (800 vs 10-37 for controls) and was positively correlated with concomitant increases in liver levels of ALA (234 μg/g vs 0 for controls) and porphobilinogen (396 μg/g vs 0 for controls). ALA-synthetase activity was increased to a lesser degree (120) in a biopsy specimen taken from this patient 40 min after death. The increase in ALA-synthetase activity during an acute attack of intermittent porphyria seemingly confirms previous postulation that this is indeed an "overproduction disease" in which an increase in the level of activity of a rate limiting enzyme results in increased biosynthesis and accumulation of subsequent metabolic products.

8270 THYROID HORMONE REGULATION OF MITOCHONDRIAL α-GLYCEROPHOSPHATE DEHYDROGENASE IN LIVER AND HEPATOMA. *(E.)* Hunt, S. M. (U. Connecticut McCook Hosp., Hartford), M. Osnos and R. S. Rivlin. *Cancer Res* 30(6):1764-1768, 1970.

The effect of thyroid hormone in rats upon the induction of mitochondrial α-glycerophosphate dehydrogenase has been studied in normal liver, in Novikoff hepatoma, in Morris hepatoma 7800, and in host liver of animals bearing Novikoff or Morris hepatomas. Enzyme activities were determined both before and 48 hr after a single i.p. injection of L-triiodothyronine, 100 μg/100 g body weight. In livers of rats bearing the rapidly growing Novikoff hepatoma, basal enzyme activity was increased 75% over levels in non-tumor-bearing controls (19.5 and 11.2 μmoles O_2/mg mitochondrial protein/min, resp.). By contrast, hepatic enzyme activity in rats bearing the more slowly growing Morris hepatoma did not differ from control levels (17.5 μmoles O_2/mg mitochondrial protein/min, in both cases). In normal animals, administration of L-triiodothyronine greatly increased activity of α-glycerophosphate dehydrogenase (from 19 to 80 μmoles O_2). In livers of animals bearing either Novikoff or Morris hepatomas, enzyme activity after administration of L-triiodothyronine was similar to levels obtained in livers of normal animals similarly treated. The activity of α-glycerophosphate dehydrogenase in Novikoff hepatoma, expressed per mg mitochondrial protein was considerably higher than in liver (130 μmoles O_2/min/mg protein), and was not induced by L-triiodothyronine. In the Morris hepatoma, basal activity was similar to that of normal liver, 10 μmoles O_2/min/mg protein and was increased 2-fold by L-triiodothyronine. Apparently, induction of α-glycerophosphate dehydrogenase by thyroid hormone was not demonstrable in the Novikoff hepatoma, was diminished but present in the Morris hepatoma 7800, and was unimpaired in liver of rats bearing either tumor.

8271 ACUTE GRANULOMATOUS DISEASE OF THE LIVER. *(E.)* Gelb, A. (New York Polyclin. Hosp., New York), N. Brazenas, H. Sussman and R. Wallach. *Amer J Dig Dis* 15(9):842-847, 1970.

Liver biopsy in 2 patients with hepatic granuloma and acute febrile condition revealed epithelioid and mononuclear cell granulomas throughout the liver. Both patients had lymphocytosis and atypical forms in the peripheral blood. Heterophil antibody titers, performed multiple times in the course of their illnesses, were normal. Both patients recovered, 1 after 3 weeks and 1 after 6 weeks. The clinical and laboratory features in these patients suggest an "infectious mononucleosis-like" illness. Similar biopsy findings are occasionally encountered in heterophil antibody-positive infectious mononucleosis.

8272 MORPHOLOGY AND HISTOCHEMISTRY OF WILSONIAN AND HEPATOGENIC GLIOPATHY IN TISSUE CULTURE. *(E.)* Mossakowski, M. J. (Polish Acad. Sci., Warsaw), K. Renkawek, Z. Krasnicka, M. Smialek and A. Pronaszko. *Acta Neuropath* 16(1):1-16, 1970.

Morphological changes occurring in glial cell cultures treated with sera from patients with Wilson's disease or hepatic coma or with copper acetate or ammonium chloride were described. In all experimental groups, Alzheimer cells type I and II, Opalski cells, and intermediate cells were observed; histochemical abnormalities appeared in the form of an accumulation of neutral and acid mucopolysaccharides in the cytoplasm of Opalski and intermediate cells, with an accompanying decrease of succinate dehydrogenase and glutamate dehydrogenase activities, and an increase in glucose-6-phosphate dehydrogenase and acid phosphatase activities. The possible pathogenic mechanism of the above changes may be related to copper and ammonia damage of the intracellular enzymatic chains involved in carbohydrate metabolism leading to an accumulation of mucopolysaccharides in glial cells.

8273 CHARACTERISTICS OF GALACTOSE-1-PHOSPHATE URIDYL TRANSFERASE IN INTESTINAL MUCOSA OF NORMAL AND GALACTOSEMIC HUMANS. *(E.)* Rogers, S. (Child. Hosp., Philadelphia, Pa.), P. G. Holtzapple, W. J. Mellman and S. Segal. *Metab Clin Exp* 19(9):701-708, 1970.

The characteristics of the activity of galactose-1-phosphate uridyl transferase were determined by the method of Bertoli and Segal in homogenates of jejunal muscle biopsies obtained from normal subjects, from 5 patients with congenital galactosemia, and from 2 obligate heterozygotes. Transferase activity in tissue from normal young adults was 12.9 mμmoles UDP galactose formed/min/mg protein while heterozygote levels were 3.7 and 3.1 mμmoles/min/mg protein. Of the five galactosemic children, three Negro patients had easily detectable activity about 10% of normal whereas Caucasian patients had none. The presence of some transferease in visceral tissue appears to delineate racial differences in galactosemic subjects further and may explain the ability of Negro galactosemics to adequately metabolize small amounts of galactose.

LIVER AND BILIARY TRACT

Acute Nonviral Hepatitis and Hepatic Injury

8316 CLINICAL AND EXPERIMENTAL STUDIES OF LIVER INJURY IN DIABETES MELLITUS: II. EXPERIMENTAL STUDIES. *(E.)* Takeuchi, J. (Sch. Med. Kanazawa U., Japan), A. Takada, Y. Nakada, G. Sawae and Y. Okumura. *Acta Hepatosplen* 17(4):228-240, 1970.

The effect of a diabetic state in alloxanized (maintained for periods up to 9 months) rats on hepatic injury caused by CCl_4 or alcohol was investigated. Rats maintained in a simulated diabetic state for more than 9 months demonstrated neither necrosis of hepatic cells nor fibrosis, and had normal serum transaminase levels. Following CCl_4 administraton (0.5 ml/100 g i.p.), levels of SGOT increased 5-6-fold in both control and diabetic animals; the SGOT values returned to normal by the 5th day in control animals, but not until the 7th day in diabetic animals. Following long term administration (20 injections) of CCl_4 (0.3 ml/100 g i.p. twice a week), in 4 of 6 rats in the diabetic group, fibrosis was pronounced both within and between lobules. In all 6 cases, the remaining hepatic cells were unequal in size due to hyperplasia and proliferation of cholangioles was seen. Fat deposition and necrosis of hepatic cells (absent in the diabetic group) were more frequent in the controls. Following a single administration of alcohol (1.5 ml/100 g of 50% solution, stomach tube), abnormalities in SGOT and SGPT levels were not seen in either the diabetic or control groups. In a study of the long term administration of alcohol (a 15% aqueous solution of alcohol replaced the drinking water), fat deposition in the liver was observed in both diabetic and control groups, the differences between the two groups being insignificant. Necrosis of hepatic cells, interstitial cell infiltration or fibrosis were not seen in either of the groups.

8317 DYNAMICS OF LIVER CELL INJURY AND REPAIR: I. SPONTANEOUS REFORMATION OF THE NUCLEOLUS AND POLYRIBOSOMES IN THE PRESENCE OF EXTENSIVE CYTOPLASMIC DAMAGE INDUCED BY ETHIONINE. *(E.)* Shinozuka, H. (U. Pittsburgh Sch. Med., Pa.), I. M. Reid, K. H. Shull, H. Liang and E. Farber. *Lab Invest* 23(3):253-267, 1970.

The fine structural alterations and selected metabolic alterations of rat hepatic cells were examined at different time intervals up to 48 hr after ethionine administration (1 mg/g wt). Nucleoli at 12 hr showed extensive fragmentation and scattering of their components; disaggregation of polyribosomes and accumulation of lipids were the prominent changes in the cytoplasm. At 20 and 24 hr the nucleoli began to regain their structure, exhibiting simple rodlike structures composed of particulate and fibrillar elements which elongated and coalesced to form nucleoli with prominent nucleolonema. Lipid accumulation progressed, and disaggregation of polyribosomes remained in the cytoplasm. Hepatic ATP levels and RNA synthesis began to recover, whereas protein synthesis remained inhibited. By 36 and 48 hr many nucleoli appeared to be morphologically normal, although a few nucleoli showed hypertrophy. The cytoplasm showed severe disorganization of organelles with persistent accumulation of lipids and formation of numerous concentric lamellar bodies. Although RNA synthesis returned toward the control value, ATP levels remained at 60 per cent of control. The early recovery in the nuclei from acute ethionine injury apparently takes place independently of the changes in the cytoplasm; this different reaction may be due to the different response of nucleus and cytoplasm to the ATP deficiency induced by ethionine.

8318 CHOLESTEROL METABOLISM AND PLASMA LECITHIN-CHOLESTEROL ACYL TRANSFERASE IN EXPERIMENTAL HEPATITIS AND CHOLESTASIS IN THE RAT. *(Ger.)* Kattermann, R. (Med. U. Clin., Gottingen, Germany) and D. I. Wolfrum. *Z Klin Chem* 8(4):413-419, 1970.

The physiological importance of lecithin-cholesterol acyltransferase in cholesterol metabolism as related to liver damage was studied in male rats. Hepatitis was induced by D-galactosamine (0.50-0.75 g/kg i.p., single dose) and intrahepatic cholestasis was produced by α-naphthylisothiocyanate (150 mg/kg p.o., single dose). Total and free cholesterol in liver and plasma and the activity of plasma lecithin-cholesterol acyltransferase were determined after 12, 24, 48 and 72 hr following treatment. A rapid decrease of plasma lecithin-cholesterol acyltransferase activity (from 1.6 to 0.14 mU/ml) occurred through galactosamine-induced hepatitis, while alanine and aspartate transaminases increased 100-fold (from 14.5 to 1680 and from 40 to 4100 mU/ml, resp.) above normal. Plasma cholesterol ester levels decreased (from 43 to 19 mg/100 ml), and free cholesterol increased considerably (from 18 to 52 mg/100 ml), while an increase of liver cholesterol esters (from 0.25 to 1.0 mg/g fresh wt) with accumulation of triglycerides occurred. Cholestasis caused a slight increase of plasma lecithin-cholesterol acyltransferase activity (from 1.6 to 1.8 mU/ml) with a slight decrease of plasma cholesterol ester levels (from 67% to 43%) and irregular increases in free cholesterol, while in the liver the relationship was reversed. Formation of cholesterol esters in plasma seems to depend on the secretion of lecithin-cholesterol acyltransferase by the liver, and a rapid decrease of this enzyme through experimental liver damage leads to lowered plasma cholesterol ester levels.

8319 INFLUENCE OF THYROID FUNCTION ON EXPERIMENTAL LIVER INJURIES. *(E.)* Kulcsar, A. (U. Med. Sch. Debrecen, Hungary), J. Kulcsar-Gergely and A. Daroczy. *Tohoku J Exp Med* 101(3):251-256, 1970.

The effect of changes in thyroid function on the healthy and intoxicated liver was investigated by determining the total dye eliminating capacity of rat liver. BSP elimination in animals with healthy liver showed no essential changes either under the influence of thyroxine treatment or following thyroidectomy. Subacute CCl_4 intoxication (0.05 ml/100 g 3 times every other day) increased the BSP level of the blood from 7.5 to 12.2 mg% whereas chronic liver injury (CCl_4) increased serum BSP concentration to 17.8 mg%. Rats receiving both thyroxine and CCl_4 showed significantly increased BSP values (24.5 mg%) as compared with those treated with CCl_4 alone (12.2 mg%). Changes in serum BSP produced by the CCl_4 treatment following thyroidectomy were not significant compared to those of thyroidectomized animals. The enhancement of the damaging effect of subacute CCl_4 intoxication of the liver by thyroxine treatment was confirmed by histological examination of 5 rat livers which revealed centrilobular hepatic cells with variable degrees of degeneration, some necrotic and balloon cells and infiltration of leucocytes and macrophages of a more serious order in the thyroxine-treated, CCl_4-treated rats than in the CCl_4-treated rats.

8320 RATES OF ENZYME ELIMINATION FROM THE LIVER INTO BLOOD PLASMA FOLLOWING ACUTE DAMAGE WITH CARBON TETRACHLORIDE. *(Ger.)* Schlosser, H. (Physiol. Chem. Inst., Friederich Schiller U., Jena, Germany). *Acta Biol Med German* 24(4):421-430, 1970.

Liver damage was produced in rats by i.p. injection of 1.25 ml/kg of CCl_4 dissolved in plant oil, and the release of sorbitol dehydrogenase and glutamic dehydrogenase by the liver into the blood stream was investigated; the half life of these enzymes was calculated from the disappearance rate from blood. A half life of 5.5 hr was estimated for sorbitol dehydrogenase, and a half life of 7.3 hr for glutamate dehydrogenase. Release of glutamate dehydrogenase from the injured liver reached its maximum 36 to 48 hr after injury, and that of sorbitol dehydrogenase after 20 to 36 hr; only insignificant amounts were released during the second half of the 96 hr observation period. The half life of both enzymes was slightly less in normal animals probably due to a reduced elimination rate, or by insufficient correction of the elimination constant of the damaged animals.

8321 MEASUREMENT OF INTRAHEPATIC SHUNTED BLOOD FLOW BY MEANS OF D-GALACTOSE-1-C^{14} IN EXPERIMENTAL HEPATIC INJURIES. *(E.)* Nakamura, T. (Tohoku U. Sch. Med., Sendai, Japan), S. Nakamura, A. Onodera, T. Aikawa and K. Kera. *Angiology* 21(8): 493-501, 1970.

The extent of intrahepatic shunt in rats with fatty liver produced by feeding of a choline-deficient diet and rats with acute and chronic CCl_4 intoxication was determined by injecting D-galactose-1-C^{14} and calculating the per cent shunt from the radioactivity of the resected liver and that of the injected solution. Rats with hepatic fibrosis showed slight increase (30%), and rats with hepatic cirrhosis showed marked increase in per cent intrahepatic shunt (73%), whereas no significant difference of per cent intrahepatic shunt between rats with hepatic carcinoma, fatty liver, acute CCl_4 intoxication and normal rats (19-25%) was seen when labeled galactose was injected into the mesenteric vein. When the D-galactose-1-C^{14} solution was injected into the hepatic artery, per cent intrahepatic shunt of rats with normal liver or acute hepatic injury was significantly higher than that of the mesenteric venous injection (44 and 48%, resp.) but the difference was not significant in hepatic cirrhosis. Per cent intrahepatic shunt of rats with hepatic carcinoma increased markedly only when the solution was injected into the hepatic artery (58-90%), probably because the cancerous tissue is supplied by the hepatic artery. and because of abnormal galactose metabolism in tumor tissue.

8322 ULTRASTRUCTURAL AND BIOCHEMICAL CHANGES ASSOCIATED WITH PYRROLIZIDINE-INDUCED HEPATIC MEGALOCYTOSIS. *(E.)* Allen, J. R. (Regional Primate Res. Ctr., U. Wisconsin, Madison), L. A. Carsteins, D. H. Norback and P. M. Loft. *Cancer Res* 30(6):1857-1866, 1970.

Rats were fed a diet containing from 0.02 to 0.08% ground *Crotalaria spectabilis* seed (a source of monocrotaline, a pyrrolidizine alkaloid) for 8 months to evaluate the biochemical and ultrastructural changes that occurred in the livers of chronically intoxicated rats that developed megalohepatocytosis. These rats had small irregularly shaped livers with disrupted architectural patterns. Microscopically, the livers were composed primarily of megalohepatocytes 2.5 times the size of the normal hepatocytes, hyperplastic bile ducts, and regenerative modules; the megalohepatocytes contained enlarged, irregularly shaped nuclei and numerous organelle-filled invaginations of the nuclear membrane protruded into the nucleoplasm. Some invaginations separated from the nuclear membrane and formed membrane-enclosed nuclear inclusions, whereas other partially enclosed invaginations resulted in a mixture of nuclear and cytoplasmic constituents. The nucleolar components were abundant and were dispersed throughout the nucleoplasm. Alterations in the cytoplasmic organelles of the megalohepatocytes included a decrease and a morphological modification of the rough endoplasmic reticulum. Lamellar arrays of smooth endoplasmic reticulum filled large portions of the cytoplasm and an increase in the size and distribution of the Golgi complex and a reduction in attached ribosomes and glycogen granules were apparent. The RNA and nitrogen levels of the affected livers were of the same magnitude as the controls, while the DNA was increased to 200%.

8323 ENHANCED TOXICITY OF CARBON TETRACHLORIDE INHALATION AFTER PHENOBARBITAL PRETREATMENT. *(E.)* Lal, H. (Dept. Pharmacol. Toxicol., U. Rhode Island, Kingston), S. K. Puri and G. C. Fuller. *Pharmacol Res Commun* 2(2):143-147, 1970.

The effects of phenobarbital pretreatment (40 mg/kg daily for 4 days i.p.) on the mortality rates due to CCl_4 inhalation and on hepatic metabolism of hexobarbital and hexobarbital narcosis were determined in rats (250-350 g). Pretreatment with phenobarbital resulted in 100% mortality after 36 hr of CCl_4 inhalation compared to 100% mortality in controls only after 48 hr; livers from the treated animals metabolized 5.9 μmoles/g/30 min of hexobarbital, while livers from the controls metabolized only 1.3 μmoles. When SKF525A (50 mg/kg i.p.) was administered to phenobarbital pretreated rats 30 min before exposure to CCl_4 vapors, hexobarbital (80 mg/kg) narcosis was blocked (50 min sleeping time for non-phenobarbital pretreated animals, 130 min for pretreated animals, and 40 min for pretreated animals with SKF525A). The increased mortality with CCl_4 inhalation after phenobarbital (which induces microsomal enzymes) pretreatment and the reduced narcosis after SKF525A (which inhibits drug-metabolizing enzumes) administration suggests that the toxicity of CCl_4 is related to its rate of metabolism by hepatic enzymes.

8324 HEPATIC TOXICITY OF PYRAZINAMIDE. *(Ger.)* Hess, W. (Ctr. Intern. Med., Johann Wolfgang Goethe U. Frankfurt, Germany), H. Jungbluth, R. Kropp and K. Zimmer. *Prax Pneumol* 24(8):486-494, 1970.

The hepatic toxicity of pyrazinamide was investigated in 103 patients with pulmonary disease (62 men, 41 women, aged 11-80), who received a mean dose of 222 g pyrazinamide over an average period of 4 months Elevation of serum transaminase was seen in 13 patients, although other tests, like serum bilirubin, BSP retention, alkaline phosphatase and serum protein fractions did not show indications of hepatic damage. Liver biopsy was performed in 6 of the 13 cases and histological signs of toxic hepatitis were observed in 4 cases. No relation between duration and dosage of pyrazinamide administration, nor to the age of the patients was seen. Only 2 of 12 patients with renal or hepatic disease before treatment showed increased serum transaminase levels during treatment, whereas serum transaminase levels were increased in 33% of the patients with a history of excess alcohol consumption. Cessation of pyrazinamide treatment was followed by normalization of serum transaminase levels in all cases. Pyrazinamide treatment in ambulatory patients with pulmonary tuberculosis should be carried out only in conjunction with frequent serum transaminase determinations.

8325 AUTORADIOGRAPHIC STUDY ON DISTURBANCE OF THE PROTEIN SYNTHESIS IN MOUSE LIVER AFTER CCl_4-INTOXICATION. *(Ger.)* Gerhard, H. (Inst. Med. Radiol., U. Wurzburg, Germany), B. Schultze and W. Maurer. *Virchows Arch Zellpath* 6(1):38-56, 1970.

Inhibition of hepatic protein synthesis from ^{3}H-L-phenylalanine and ^{3}H-L-tyrosine was investigated autoradiographically in female mice after i.p. administration of 0.002-8.0 ml/kg of CCl_4 over a period of 30 min to 47 hr. The degree of inhibition of protein synthesis between 0.002 ml/kg and 0.1 ml/kg was dose-dependent, affecting between 0% and 57% of the centri lobular parenchyma. Maximal inhibition for each dose was noted as soon as 30 min after CCl_4 administration inhibition and histopathological signs of cell damage were reversible. Larger amounts, 0.1 ml/kg to 8.0 ml/kg did not increase the area (57%) affected by loss of protein synthesis, but produced in this area a dose-dependent cell damage (loss of basophilia, fatty degeneration, plasma hyalinization), pyknosis and finally necrosis.

8326 LYMPHOCYTE STIMULATION INDUCED BY HALOTHANE IN PATIENTS WITH HEPATITIS FOLLOWING EXPOSURE TO HALOTHANE. *(E.)* Paronetto, F. (Mt. Sinai Hosp., New York, N. Y.) and H. Popper. *New Eng J Med* 283(6):277-280, 1970.

Incubation of lymphocytes from patients with halothane hepatitis with halothane (dilute preparation) for 3-6 days caused lymphocyte stimulation, as measured by incorporation of ^{3}H-thymidine into the deoxyribonucleic acid of lymphocytes. Lymphocytes of a patient with hepatic damage attributable to methoxyflurane were stimulated by methoxyflurane, but no stimulation was observed in healthy controls, patients with hepatic disease or patients exposed to halothane without liver damage. Preliminary data indicated that sensitization was temporary. Australia antigen was not detected in the sera of the patients, but antimitochondrial antibodies seemed to correlate with lymphocyte stimulation. Stimulation of lymphocytes in the presence of halothane is helpful in the differential diagnosis of viral and halothane hepatitis, and indicates that in some patients, the anesthetic may be a sensitizing agent with a pathogenetic role in the hepatic damage.

8327 5-HYDROXYTRYPTAMINE-INDUCED LESIONS OF THE MOUSE LIVER. *(E.)* Penttila, A. (Dept. Anat., U. Helsinki, Finland). *Pharmacology* (6):321-329, 1970.

The effect of prolonged (60 days) i.p. administration of 5-hydroxytryptamine (40 mg/kg/day) on the morphology of liver cells was studied by light and electron microscopy in 10 adult female mice. After 60 days about 80% of the mice had patchy necrotic liver lesions, mostly at the lower margins of both the liver lobes. Fibrous scar tissue occurred in the center of the lesions and was surrounded by a necrotizing zone in which the cytoplasm of liver cells contained plenty of PAS-reactive material. Small droplets of highly osmiophilic material were accumulated in the cytoplasm of liver cells of the necrotizing zone becoming confluent in lysosome-like bodies and larger aggregates and finally forming fibrous scar areas.

8328 CYTOLOGIC EFFECTS OF RESERPINE ON HEPATOCYTES: AN ULTRASTRUCTURAL STUDY OF DRUG TOXICITY. *(E.)* Winborn, W. B. (U. Texas Med. Sch., San Antonio) and L. L. Seelig, Jr. *Lab Invest* 23(2):216-229, 1970.

Large doses of reserpine (50 mg/kg) resulted in striking cytological alterations in hepatocytes of hamsters as seen by electron microscopy. The most prominent morphologic feature was the appearance of two types of lipid droplets randomly scattered throughout the cytoplasm; one form of these droplets was apparent as a circular profile containing a homogenous material of moderate electron density and the other was evident as a circular profile consisting of an outer electron-dense portion and an inner electron-lucid core. Both types of lipid droplets were separated from the cytoplasmic matrix by a membrane system and were frequently associated with autophagic material. A large increase in the amount of smooth-surfaced endoplasmic reticulum was seen, and the limiting membranes of microbodies were often observed in direct continuity with the membrane system of this agranular endoplasmic reticulum. Mitochondria lacked intramitochondrial granules, appeared enlarged and closely packed together and exhibited bizarre profiles. A decrease in the size of the hepatocytes and in the amount of glycogen were also seen.

LIVER AND BILIARY TRACT

Acute Viral Hepatitis

8346 DETECTION OF A NEW SERUM-ANTIGEN IN THREE EPIDEMICS OF SHORT-INCUBATION HEPATITIS. *(E.)* Del Prete, S. (Inst. Clin. Med., U. Milan, Italy), M. Doglia, A. Ajdukiewicz, R. A. Fox, D. Constantino, A. Graziina, F. J. Dudley and S. Sherlock. *Lancet* 2(7673):579-581, 1970.

Three outbreaks of epidemic (short-incubation) hepatitis have been studied in Italy and England. Sera from the patients in all 3 have been consistently negative for Australia antigen. Using a new antibody, obtained from a multiply-transfused patient, a new antigen has been detected by gel diffusion, and this has been called epidemic-hepatitis-associated antigen. This antigen was found in the sera of 65% of the patients in the 3 epidemics and in 90% of those tested during the first 2 weeks of their illness and disappeared from the serum during convalescence. Epidemic-hepatitis-associated antigen was not found in 2000 control subjects or in 50 patients with various viral illnesses.

8347 FECAL ANTIGEN IN VIRAL HEPATITIS. *(E.)* Ferris, A. A. (Fairfield Hosp., Victoria, Australia), J. Kaldor, I. D. Gust and G. Cross. *Lancet* 2(7666):243-244, 1970.

An antigen has been detected in fecal extracts from 90 out of 220 patients with viral hepatitis and from 5 of 158 patients with other diseases. Single precipitin lines with absorbed rabbit antiserum G2 in a gel-diffusion test were observed with fecal extracts from 41% of patients with viral hepatitis and 3% of non-hepatitis patients. This antigen was present early in the disease and usually disappeared within three weeks of the first appearance of dark urine; it seemed to be particulate and was serologically distinct from Australia antigen.

8348 NEUROLOGICAL SEQUELAE IN PATIENTS WHO BECAME LONG-TERM SURVIVORS AFTER RECOVERING FROM HEPATIC COMA DUE TO VIRUS HEPATITIS FOLLOWING EXCHANGE TRANSFUSIONS. *(E.)* Thomas, E. (Stanley Med. Coll., Madras, India) and K. Natarajan. *Indian Pract* 23(4):259-261, 1970.

Neurological abnormalities encountered in 3 patients in terminal hepatic coma due to virus hepatitis, following recovery from coma were examined. Two of the 3 patients who became long term survivors from hepatic coma due to fulminating virus hepatitis had neurological sequelae; one had transient right-sided hemiplegia for 3 days from which he recovered completely, and the other had peripheral neuropathy with bilateral footdrop and stocking type of sensory loss with only partial recovery at the end of 3 1/2 months. The neurological disorder in the first patient may have been a result of focal cerebral ischemia due to vascular spasm, and in the second patient due to the accumulation of unidentified toxic metabolites such as those which can cause portal systemic encephalopathy itself.

8349 AUTOANTIBODIES AND THE HEPATITIS-ASSOCIATED ANTIGEN IN ACUTE INFECTIVE HEPATITIS. *(E.)* Farrow, L. J. (St. Mary's Hosp., London, England), E. J. Holborow, G. D. Johnson, S. G. Lamb, J. S. Stewart, P. E. Taylor and A. J. Zuckerman. *Brit Med J* 2(5711):693-695, 1970.

Sera from 39 unselected patients with acute infective hepatitis diagnosed on clinical, epidemiological and pathological findings were tested for the presence of autoantibodies by immunofluorescent and immunodiffusion techniques. Smooth muscle antibody was found in 87% and hepatitis-associated antigen in 33% of the patients; the incidence of smooth muscle antibody was highest during the first month after the onset of symptoms, and the antibody was preponderantly IgM at this stage. Smooth muscle antibody and hepatitis-associated antigen occurred independently, and unlike hepatitis-associated antigen, which was strongly associated with possible parenteral exposure to infection, the incidence of smooth muscle antibody was not related to the presumed mode of exposure. The production of smooth muscle antibody seems to be more directly related to liver cell damage than to the presence of hepatitis-associated antigen in the serum.

LIVER AND BILIARY TRACT

Chronic Hepatitis

8364 AUSTRALIA ANTIGEN AND AUTOANTIBODIES IN CHRONIC HEPATITIS. *(E.)* Vischer, T. L. (Burger Hosp., Basel, Switzerland). *Brit Med J* 2(5711):695-698, 1970.

The sera of 110 patients with chronic hepatitis and adequate controls were examined for autoantibodies to smooth muscle, mitochondria, and for antinuclear factors by the immunofluorescence method, and for Australia antigen by a modified micro-Ouchterlony immunodiffusion technique. Twelve out of 13 patients with primary biliary cirrhosis had mitochondrial antibodies, 2 had antinuclear factor, and none had Australia antigen in their sera. In chronic aggressive hepatitis 23.5% of the sera contained antinuclear factor, 13% smooth muscle antibodies, 10.5% mitochondrial antibodies, and 22% Australia antigen. Of the 12 patients with chronic persistent hepatitis, 1 had antinuclear factor, 1 smooth muscle antibodies, and 3 Australia antigen. The most striking finding was a mutual exclusion between Australia antigen and mitochondrial and smooth muscle antibodies. None of the 33 patients with 1 or the other form of chronic hepatitis and mitochondrial or smooth muscle antibodies had Australia antigen; 22 out of 77 (28%) patients without other antibodies were positive for Australia antigen.

LIVER AND BILIARY TRACT

Cirrhosis

8369 ZINC AND COLLAGEN CONTENT OF CIRRHOTIC LIVER. *(E.)* Boyett, J. D. (VA Hosp., Portland, Ore.) and J. F. Sullivan. *Amer J Dig Dis* 15(9):797-802, 1970.

Liver samples obtained from 43 consecutive autopsies were analyzed for their content of zinc and collagen nitrogen (as calculated from liver hydroxyproline and nitrogen content). Mean liver zinc was 2.36 and 1.27 μg/mg nitrogen for histologically normal and cirrhotic samples, resp.; collagen nitrogen was 1.67 and 4.26 mg/g wet liver for normal and cirrhotic samples, resp. There was an absolute reduction in zinc content of cirrhotic liver and that this reduction had no relationship to the amount of collagen present; however, a good correlation existed between the amount of zinc/mg nitrogen and the amount of zinc/mg noncollagen nitrogen.

8370 NATURE OF THE HUMORAL AGENT RESPONSIBLE FOR PORTACAVAL SHUNT-RELATED GASTRIC HYPERSECRETION IN MAN. *(E.)* Orloff, M. J. (Sch. Med., U. California, San Diego), A. G. Abbott and H. Rosen. *Amer J Surg* 120(2):237-243, 1970.

Studies of basal gastric acid secretion, Histalog-stimulated acid production, and the acid secretory response to distention of the jejunum with a balloon for 20 minutes were conducted in 5 normal subjects, 10 patients with compensated cirrhosis, and 10 comparable cirrhotic patients with portacaval shunts. Every patient had an actively functioning gastric mucosa which was capable of responding vigorously to humoral stimuli. Balloon distention of the jejunum did not stimulate acid production in normal subjects and unshunted cirrhotics, whereas cirrhotics with portacaval shunts responded to intestinal distention with a prolonged and significant output of acid that averaged more than 8 times that of the unshunted subjects, and was almost as great as that observed previously in tests with intestinal meals. The acid secretory response was distinguished by a delay in development, and persisted long after withdrawal of the stimulus, both of which are characteristic of hormone action. The humoral agent responsible for portacaval shunt-related gastric hypersecretion in man is apparently a hormone of endogenous origin. The role of acid hypersecretion in the alleged clinical association of peptic ulcer and portacaval shunt remains to be determined.

8371 COMPARISON OF FREE PORTAL VENOUS PRESSURE AND WEDGED HEPATIC VENOUS PRESSURE IN PATIENTS WITH CIRRHOSIS OF THE LIVER. *(E.)* Vaillet, A. (St. Luke Hosp., Montreal, Quebec, Canada), J. C. Joly, D. Marleau and P. Lavoie. *Gastroenterology* 59(3):372-375, 1970.

Combined hepatic and umbilicoportal catheterization was performed in 43 compensated cirrhotic patients in order to compare free portal venous pressure and wedged hepatic venous pressure. The umbilicoportal catheter was positioned in the portal vein (41 patients) or the left branch of the portal vein (2 patients). Wedged hepatic venous pressure was equal to free portal venous pressure in 17 patients, and the difference between these two parameters was between 0.5 and 1 mm Hg in 17 other patients. In the other 9 patients, the difference ranged from 1.5 to 4 mm Hg. In patients with cirrhosis, there appears to be a highly significant correlation between wedged hepatic venous pressure and free portal venous pressure.

8372 A VARIANT OF OBSTRUCTIVE BILIARY CIRRHOSIS. *(E.)* MacMahon, H. E. (Tufts-New Eng. Med. Ctr., Boston, Mass.). *Amer J Path* 60(3):371-384, 1970.

A case of obstructive biliary cirrhosis of infancy associated with atresia of the common bile duct was described. Laparotomy performed at 6 wk on a full-term infant weighing 5 lb at birth and who became jaundiced on the second day after birth revealed a complete lack of development of the large collecting bile ducts which were represented by a broad, solid, short fibrous strand. The liver which was normal in size was firm and deeply bile stained. A surgical specimen from the liver margin resembled the histologic picture of obstructive cirrhosis, and the portal areas were enlarged and their bile ducts were distended with bile. An unusual hyperplasia of fibrous tissue which extended from the portal areas into the adjacent liver lobules was found. The clinical course was steadily downhill with elevations of bilirubin levels (both direct and indirect), hepatic enzymes and serum ammonia (terminally, 375 μg/100 ml). The infant, at 8 months of age, showing signs of portal hypertension, experienced vascular collapse and died. At necropsy, the liver was 350 g and was overgrown with fibrous tissue accompanied by a proliferation of small bile ducts or cholangioles, a loss of liver parenchyma and progressive stenosis of the large bile ducts ending in atresia.

8373 ALBUMIN SYNTHESIS IN LIVER SLICES OF CIRRHOTIC RATS. *(E.)* Huberman, A. (Natl. Inst. Nutr., Tlalpan, Mexico) and G. Soberon. *Clin Chim Acta* 29(1):121-127, 1970.

The ability to synthesize albumin was studied in young male rats with moderate liver cirrhosis induced by repeated (10) i.p. injection of CCl_4. After 10 injections of CCl_4, the liver presented the histologic image of cirrhosis (diffuse fibrosis with pseudo-lobule formation). There was an increase of the liver weight/body weight ratio corresponding to cirrhotic hypertrophy. The protein content of the liver was practically unchanged but the DNA content (expressed as μg/mg of protein) was increased (reflecting hepatocyte regeneration and leucocyte infiltration) and there was an important increase in the incorporation of labeled amino acid into soluble protein. Albumin production during incubation (measured by precipation with a specific antibody) increased in the same proportion in normal and in cirrhotic liver slices, and labeled amino acid was incorporated into albumin to the same degree in both normal and cirrhotic liver slices.

8374 CHOLESTEROL LOWERING, FECAL BILE ACID AND STEROL CHANGES DURING NEOMYCIN AND COLCHICINE. *(E.)* Rubulis, A. (Highland Hosp., Rochester, N. Y.), M. Rubert and W. W. Faloon. *Amer J Clin Nutr* 23(9):1251-1259, 1970.

Changes in serum cholesterol, fecal sterols, and bile acids caused by the p.o. administration of neomycin (6 g/day) were studied in 3 obese subjects and 1 hypocholesteremic cirrhotic patient. Four other obese subjects were studied similarly, 2 while they were given oral colchicine (2.4 mg/day) and 2 while receiving combined neomycin and colchicine. Coincident with decreases in serum cholesterol, fecal bile acid and sterol excretion increased during neomycin with reversal of the changes when it was withdrawn. The pattern of fecal excretion was also changed with a predominance of primary bile acid appearing and cholesterol replacing coprostanol during antibiotic administration. Colchicine also increased fecal sterol and bile acids coincident with lowering of serum cholesterol, but serum triglyceride levels varied without relation to drug administration. Combined neomycin and colchicine therapy produced no clear-cut additive effects. A probable common mechanism of cholesterol lowering by neomycin and colchicine may be due to interference with the enterohepatic cycle of bile acids and neutral sterols.

8375 OBSERVATIONS ON THE NITROGEN METABOLISM OF PATIENTS WITH PORTAL CIRRHOSIS. *(E.)* Rudman, D. (Emory U. Sch. Med., Atlanta, Ga.), S. Akgun, J.T. Galambos, A.S. McKinney, A.B. Cullen, G.G. Gerron and C.H. Howard. *Amer J Clin Nutr* 23(9): 1203-1211, 1970.

Nitrogen balance and serum amino acid concentrations were measured in 2 subjects without liver disease and in 6 patients with advanced portal cirrhosis and a history of hepatic coma during alternating periods of 120 g protein and 2 g protein isocaloric (35 kcal/kg day) diets. On the 120 g protein diet, the nonhepatic cases were within ±1 g-day nitrogen balance, due to a markedly lower excretion of urea than the nonhepatic cases. The cirrhotics also showed 2- to 15-fold elevations above normal in fasting serum concentrations of methionine, tyrosine, phenylalanine, and proline while consuming the high protein diet. These abnormalities in the fasting serum amino acid pattern were improved or corrected by 2-10 days of treatment with the 2 g, 35 kcal/kg diet. The serum total α-amino nitrogen concentration, normally 5-7 mg/100 ml, did not increase detectably in the two nonhepatic subjects 2 or 4 hr after a 60 g protein meal, but in the cirrhotic patients this value regularly increased from 8 to 11 mg/100 ml at 2 or 4 hr.

8376 DEVELOPMENT OF EXPERIMENTAL LIVER CIRRHOSIS BY D-GALACTOSAMINE: HISTOLOGICAL, BIOCHEMICAL AND AUTORADIOGRAPHIC STUDIES IN RATS. *(Ger.)* Lesch, R. (Path. Inst. U. Freiburg, Germany), D. Keppler, W. Reutter, J. Rudiger, W. Oehlert and K. Decker. *Virchows Arch Zellpath* 6(1):57-71, 1970.

Chronic progressive hepatitis developing within 6 months to cirrhosis was induced in rats by the i.p. administration of D-galactosamine•HCl (250 mg/kg daily for 8 months). The pathological process started with focal necroses of parenchyma and periportal proliferation of mesenchymal cells and bile ducts. During this initial phase the serum enzyme activities were not considerably elevated. In the stage of cirrhosis the parenchymal alterations were less pronounced while autoradiographic analysis after administration of thymidine-^{3}H showed an increasing proliferation of mesenchymal cells. In contrast to the increased regenerative proliferation of the epithelial cells in the precirrhotic stage, a different intensity of proliferation was observed in parenchymal nodules, indicating a focal alteration of tissue differentiation. After galactosamine administration for 6 months the liver glycogen and glucose contents were reduced (from 191 to 74 and from 6 to 3 μmole/g liver wet wt, resp.) whereas the ATP level was normal. The changes in concentrations of uridine phosphates (UTP, UDP, UMP), UDP-sugars, and of galactosamine metabolites indicated an adaptation of uracil nucleotide and galactosamine metabolism in chronically galactosamine-treated rat liver. The immune suppressive compound azathioprin did not influence the development of liver cirrhosis.

LIVER AND BILIARY TRACT

Gallbladder and Biliary Tract Diseases

395 STUDIES OF BILE AS A SUSPENDING MEDIUM AND ITS RELATIONSHIP TO GALLSTONE FORMATION. *E.)* Ostrowitz, A. (St. U. New York, Downstate Med. tr., Brooklyn) and B. Gardner. *Surgery* 68(2):329-33, 1970.

he stability of bile suspensions in relation to allstone formation was studied by measuring the zeta potential (Helmholtz-Smoluchowski formula) of human, rabbit, and dog bile using a standard particle, minusil. In human and rabbit bile, zeta potential were close to zero until 1:4 dilutions were made with isotonic sucrose; then the average potentials (mv) were -16.5 and 13.5, resp. Dog bile was determined undiluted and showed an average potential of -41.0 mv. Heparin (100 U) added to the human bile permitted the use of less diluted bile (1:2) and showed increased zeta potential (-31.0). Florantyrone (Zanchol) reduced the viscosity of the human bile and changed its color but did not affect the zeta potential of the suspended particles. The zeta potential of gallstones (dried and ground) obtained from 5 patients at operation was similar to the results obtained with minusil particles (range of -7 to -20 for the gallstones compared to -9.4 to -28.7 mv for the standard particles) and falls into the range where agglomeration occurs (-20 to -10 mv).

8396 THE PROTEINS OF HUMAN GALLBLADDER BILE WITH AND WITHOUT GALLSTONES. *(E.)* Englert, E., Jr. (U. Utah Med. Ctr., Salt Lake City). *Clin Chim Acta* 29(2):319-331, 1970.

The proteins in seventy-four human gallbladder bile samples were analyzed by techniques of disc-gel electrophoresis combined with immunodiffusion and standard gel-immunoelectrophoresis, employing antiserum to human serum proteins and antisera against normal and against stone-containing human gallbladder bile. Numbers of proteins averaged 6 to 8/sample with a range up to 16; albumin and pigment were commonest and greatest in amount. Serum proteins were identified immunochemically and averaged 4 to 6/sample with a range up to 13. Bile-specific protein was demonstrated by: (a) quantitatively more proteins by chemical staining than by reaction with antiserum to human serum; (b) quantitatively more reactions with anti-bile than with anti-serum antisera; (c) reactions of non-identity along the electrophoretic migration pathway; and (d) immunoreactions to anti-bile-antiserum-absorbed-with-whole-serum on combined disc electrophoresis-immunodiffusion, standard immunoelectrophoresis and Ouchterlony immunodiffusion. One to 4 specific proteins were demonstrated in from 8% to 95% of bile samples tested by any one of these methods. These proteins occurred preponderantly in pigment-prealbumin and α_1-globulin zones of standard immunoelectrophoresis and in post-albumin and pre-stacking gel zones of disc electrophoresis. Evidence for a difference in specific proteins between normal and stone bile was obtained when differences were demonstrated beyween anti-normal-bile and anti-stone-bile antisera. The presence of a "protective" protein in normal bile which is missing in stone bile or the presence of an "abnormal" protein in stone bile may contribute to gallstone formation.

8397 VERY HIGH LEVELS OF SGOT AND LDH IN PATIENTS WITH EXTRAHEPATIC BILIARY TRACT OBSTRUCTION. *(E.)* Ginsberg, A. L. (Walter Reed Army Inst. Res., Washington, D.C.). *Amer J Dig Dis* 15(9):803-807, 1970.

Three cases of extrahepatic biliary disease with transaminase levels exceeding 1000 mU/ml and with minimal morphologic evidence of liver damage were reported. Very high levels of SGOT (1710, 2450 and >1250 mU/ml) and lactate dehydrogenase (1275, 1740 and 1300 mU/ml) were found in these patients with extrahepatic obstruction due to gallstones (the diagnoses were established at operation, and viral hepatitis was ruled out by liver biopsy). Extrahepatic biliary obstruction apparently can produce very high SGOT and lactate dehydrogenase levels in the absence of hepatocellular necrosis.

8398 BIOCHEMICAL AND HISTOCHEMICAL STUDY ON FATTY ACID-CALCIUM GALLSTONES. *(E.)* Sanjo, T. (Tohoku U. Sch. Med., Sendai, Japan). *Tohoku J Exp Med* 101(3):237-249, 1970.

Chemical, mineralogical and histochemical investigations of fatty acid-calcium stones were carried out on gallstones from 3 patients. Systematic chemical analysis, infrared spectroscopy and gas chromatography revealed that the predominant fatty acid in these stones was palmitic acid; small amounts of stearic acid and oleic acid were also detected. Fatty acid-calcium gallstones showed a laminated structure characterized by eccentrically arranged layers; examination under polarized light revealed fatty acid-calcium crystals between the layers of bile pigment particles which extended outwards in a fan-shape. Histochemical examination revealed the presence of diffuse networks of acid mucopolysaccharides containing sulfated radicals in fatty acid-calcium stones, suggesting that these substances played an important role in holding crystals and particles together as bridges among other components of the stones. Severe infection of the biliary tract, release of fatty acid-calcium into the bile by enzymes and concurrent formation of composite materials by acid mucopolysaccharide seem to be essential in the formation of gallstones of this type.

8420 SELECTIVE ARTERIAL DRUG INFUSIONS IN THE TREATMENT OF ACUTE GASTROINTESTINAL BLEEDING. *(E.)* Rosch, J. (U. Oregon Med. Sch., Portland), R. K. Gray, J. H. Grollman, G. Ross, R. J. Steckel and M. Weiner. *Gastroenterology* 59(3):341-349, 1970.

Acute gastrointestinal bleeding was treated by selective arterial infusions of vasoconstrictors. The effects of selective infusions of a combination of epinephrine (3.8 μg/min) and propranolol (3 ng/min) and of pitressin (0.3-4 U/min) into the superior mesenteric artery were explored first in 12 dogs. Subsequently, 5 patients with massive acute gastrointestinal bleeding were treated successfully by selective arterial infusions of propranolol (5 mg/2 min) and epinephrine (4-8 μg/min).

8421 GLOVE STARCH GRANULOMATOUS PERITONITIS. *(E.)* Taft, D. A. (Mason Clin., Seattle, Wash.), J. T. Lasersohn and L. D. Hill. *Amer J Surg* 120(2):231-236, 1970.

Clinical manifestations, operative and pathologic findings in a recent epidemic of glove starch granulomatous peritonitis due to rice starch were described. Characteristically, severe abdominal pain developed 2 to 6 weeks postoperatively and was sometimes accompanied by fever, leucocytosis, nausea and vomiting. Examination of the abdominal cavity revealed ascites, dense fibrous adhesions, and starch-filled miliary nodules, while microscopic examination revealed a foreign body-type granulomatous reaction with foamy cytoplasmic histiocytes, multinucleated giant cells, eosinophils, polymorphonuclear leucocytes, and lymphocytes. Steroid treatment assisted the recovery; meticulous removal of all powder from surgical gloves and equipment is imperative to prevent this problem.

8422 IMMUNITY IN EXPERIMENTAL SALMONELLOSIS: I. PROTECTION INDUCED BY ROUGH MUTANTS OF SALMONELLA TYPHIRMURIUM. *(E.)* Germanier, R. (Swiss Serum Vaccine Inst., Berne). *Infect Immun* 2(3):309-315, 1970.

Different rough mutants of *Salmonella typhimurium* were tested to determine their virulence and immunizing capacity when used as live vaccines for mice. All uridine diphosphate-galactose-4-epimeraseless mutants tested were much more potent immunizing agents than any other mutants. This capacity was not correlated with virulence or complexity of cell wall polysaccharide. For good protection, persistence of the rough strains *in vivo* was essential, but the protection lasted longer (4 weeks) than the period during which bacteria were demonstrable in the liver and spleen of the mice. The outstanding immunizing capacity of the epimeraseless mutants was apparently not dependent on the persistence of viable bacteria in the mouse, but may be related to the manner in which lipopolysaccharide synthesis is blocked in challenge organisms.

8423 A SURVEY OF INFANTILE GASTROENTERITIS. *(E.)* Ironside, A. G. (Monsall Hosp., Manchester, England), A. F. Tuxford and B. Heyworth. *Brit Med J* 3(5713):20-24, 1970.

The most common biochemical abnormality found in 339 cases of infantile gastroenteritis accompanied by dehydration was hypernatremia, sometimes with metabolic acidosis. A higher incidence of dehydration was found in the patients who had received p.o. glucose fluids before admission. Enteropathic *E. coli* were isolated from the feces of 16% of the cases; associated infections, especially of the respiratory tract, were common. Treatment was aimed at the restoration of fluid and electrolyte balance with p.o. fluids, though i.v. fluids were used in the most severely dehydrated cases. Recovery was complete in 320 cases and a further 14 cases were discharged as carriers of enteropathic *E. coli;* 5 deaths, 3 immediately after admission, occurred in the series.

8424 THE LOCATION OF *ESCHERICHIA COLI* IN THE PIG INTESTINE. *(E.)* Arbuckle, J. B. R. (Roy. Vetr. Coll., Hertfordshire, England). *J Med Microbiol* 3(2):333-340, 1970.

The localization of enteropathogenic strains of *Escherichia coli* in the porcine intestine of naturally occurring and experimentally reproduced cases of *E. coli* diarrhea was studied mainly by fluorescent staining techniques. Three different enteropathogenic strains were found on villi of the small intestine, but only small numbers of these bacteria were found on the colonic mucosa except when they were contiguous with the mass of bacteria in the lumen. A non-enteropathogenic strain of *E. coli* was found on villi of the small intestine in small numbers. Coliform attachment to villi was found to be most marked when diarrhea was clinically well established, but such attachment was also sometimes observed during the early clinical stages of diarrhea. Adhesion of *E. coli* to small-intestinal villi appears to be a significant lesion of porcine diarrhea associated with enteropathogenic strains of *E. coli*.

8425 CENTRAL VENOUS PRESSURE IN CLINICAL MANAGEMENT OF ACUTE GASTROINTESTINAL BLEEDING. *(E.)* Northfield, T. C. (Guy's Hosp., London, England) and T. Smith. *Lancet* 2(7673):584-586, 1970.

Central venous pressure, red-blood-cell volume, blood-volume, and fecal blood-loss were determined in 23 patients with acute upper gastrointestinal tract bleeding. In 13 patients transfusion to a normal central venous pressure (5 cm water) brought the patient's blood-volume to a value within the normal range in 95% of cases. All of 6 patients having an initial transfusion requirement, based on central venous pressure measurements, of more than 6 pints of blood subsequently rebled. Of 12 patients having a definite rebleed during the course of central venous pressure measurements, as demonstrated by a fall in red-blood-cell volume together with abnormal fecal blood-loss, 10 showed a rapid fall in central venous pressure to zero, but only 6 had a hematemesis; of the 6 patients not having a hematemesis, only one had an early change in pulse-rate or blood-pressure. Central venous pressure can be useful in assessing transfusion requirements, recurrent hemorrhage probability, and in early detection of recurrent hemorrhage.

8426 THE EFFECT OF REFEEDING ON PANCREATIC EXOCRINE FUNCTION IN MARASMIC INFANTS. *(E.)* Solimano, G. (Hosp. Roberto Del Rio, Santiago, Chile), O. Danus, A. M. Urbina and I. Valenzuela. *J Pediat* 77(2):334-337, 1970.

Parasitology

8485 COMPARATIVE EVOLUTION OF THE FLUORESCENT ANTIBODIES DIRECTED AGAINST THE LARVAL STAGES AND THE ADULTS OF *SCHISTOSOMA MANSONI:* I. EXPERIMENTAL SCHISTOSOMIASIS IN UNTREATED MICE. *(E.)* Truong, T. K. (Swiss Trop. Inst., Basel, Switzerland), G. Sarasin and P. Ambroise-Thomas. *Ann Trop Med Parasit* 64(1):87-92, 1970.

The sequence of appearance and the evolution of the antibodies corresponding to the different stages of the life cycle of schistosomes was studied in mice harboring a bisexual infection of *Schistosoma mansoni.* Each blood sample was tested by the indirect fluorescent antibody method against frozen sections of parasitized mouse liver (adult worm- and egg-antigen) and, simultaneously, against frozen sections of schistosome-infected hepato-pancreas of *Biomphalaria glabrata*(cercarial antigen). The anti-cercarial antibodies appeared early and predominated around the 40th day after infection. The antibodies against the adults and the eggs showed an almost identical evolution, but they appeared later than cercarial antibodies and reached their maximum level only around the 70th day after infection.

8486 COMPARATIVE EVOLUTION OF THE FLUORESCENT ANTIBODIES DIRECTED AGAINST THE LARVAL STAGES AND THE ADULT OF *SCHISTOSOMA MANSONI:* II. EXPERIMENTAL SCHISTOSOMIASIS IN MICE AFTER TREATMENT WITH NIRIDAZOLE. *(E.)* Ambroise-Thomas, P. (Swiss Trop. Inst., Basel, Switzerland), G. Sarasin and T. K. Truong. *Ann Trop Med Parasitol* 64(1):93-99, 1970.

The fluorescent cercarial, adult-worm and egg antibodies were studied in mice infected with *Schistosoma mansoni* and treated with niridazole at different intervals after infection. Except when administered very early during the infection, niridazole treatment (150 mg/day for 10 days) provoked a significant rise of antibodies against the adults and the eggs, whereas the antibodies directed against the cercariae were only slightly modified. After a radical cure, the antibodies disappeared about 170 days later, but they persisted at a low titre if some worms, even in very low numbers, survived the treatment. This phenomenon, which has already been reported in man, seems to be connected with the liberation of somatic antigens following the lysis of the schistosomes.

8487 INTESTINAL PROTEIN LOSS IN SCHISTOSOMAL POLYPOSIS OF THE COLON. *(E.)* Lehman, J. S., Jr. (U.S. Naval Med. Res. Unit #3, Cairo, Egypt), Z. Farid, S. Bassily, J. Haxton, M. F. A. Wahab and D. C. Kent. *Gastroenterology* 59(3):433-436, 1970.

Excessive intestinal protein loss was demonstrated in 5 of 6 patients with colonic polyposis due to *Schistosoma mansoni* infection. The degree of protein loss was associated with the extent of polyposis and mucosal inflammation and ulceration but not with the intensity of infection as measured by the 24-hr excretion of schistosome eggs. This previously undescribed complication of intestinal schistosomiasis may lead to serious depletion of the body albumin in patients with concomitant protein malnutrition, resembling depletion of body iron stores due to chronic blood loss from schistosomal polyposis.

8488 *TOXOPLASMA GONDII:* RESISTANCE AND TRANSMISSION THROUGH GASTROINTESTINAL TRACT. *(Fr.)* Cranz, G. (Fac. Med. Strasbourg, France) and M. Kremer. *J Med Strasbourg* 1(5):389-391, 1970.

DESCRIPTION OF INDEXES

SUBJECT and AUTHOR INDEXES for Gastroenterology Abstracts and Citations, Volume 5, are produced from on-line computer print-out of key-punched cards.

The SUBJECT INDEX is based on a hierarchial system of classification in which *major index terms* are modified by one or more *key word descriptors*. The *key word descriptors* are listed in decreasing order of importance and describe the content of the abstract or citation. In addition, in this indexing system, some *key word descriptors* will also be used as *major index terms*, thus providing in-depth indexing of each document. An abstract or citation number, in brackets, will be found after the *key word descriptors*. Abstracts will be identified by an asterisk outside of the brackets.

An illustrative example of this indexing system follows:

INTESTINE, LARGE
    Colon, Carcinoma, Radiological Detection, Rectum (0188)*

COLON
    Cancer, Polyps, Radiological Detection (0188)*

RECTUM
    Cancer, Polyps, Precancerous (0188)*

CANCER
    Large Intestine, Detection, Radiology (0188)*

DIAGNOSIS
    Radiology, Cancer, Large Intestine (0188)*

Numbers followed by an asterisk refer to abstracts in the text. Other numbers refer to citations.

SUBJECT INDEX

- ABDOMEN
  - ACUTE, ANTICOAGULANTS, INTESTINAL HEMORRHAGE, THERAPY (8478)
  - BLUNT TRAUMA (8462)
  - EXPLORATORY LAPAROTOMY, DIAGNOSTIC PROCEDURE, INDICATIONS (8032)
  - PAIN, SURGERY (8438)
  - TRAUMA, PANCREATIC INJURY, SURGERY (8232)
- ABSORPTION
  - DIGESTION, AGE DEPENDENCY, GASTROINTESTINAL TRACT (7849)
  - ELECTROLYTES, WATER, RECTUM, COLON, MAN (7845)
  - FOOD LOAD, MUCOSA, ENZYMES (7827)*
  - HYDROGEN ION, SODIUM, GASTRIC MUCOSA (7833)*
  - ILEUM POTENTIAL, ALANINE, GLUCOSE (7844)
  - INTESTINAL, GASTRITIS, RESORT TREATMENT (8129)
  - INTESTINE, FOOD INTERACTION, DRUG INTERACTION, RAT (7846)
  - INTESTINE, PHARMACOKINETICS, MATHEMATICAL PROCEDURES (7851)
  - IRON, GASTROINTESTINAL TRACT, COBALT (7832)*
  - IRON, QUANTITATION, WHOLE-BODY COUNTING (7842)
  - JEJUNUM, IMPAIRED, AMINO ACID (7835)*
  - LYMPH, CORN OIL, EXCRETION (7828)*
  - NITROGEN, FAT, MINERALS, KWASHIORKOR, CHILDREN (8483)
  - PERITONEAL CELL, 125 I LABELED HUMAN SERUM ALBUMIN, MOUSE (7839)
  - RADIOIRON, NEOMYCIN, GERMFREE RATS (7829)*
  - SMALL INTESTINE, EPITHELIAL CELL, CARBOHYDRATE METABOLISM (7989)
  - STOMACH POUCH, SURFACTANT, HYPERABSORPTION (7843)
  - SUCROSE, METABOLITE, INTESTINE (7850)
- ACHALASIA
  - NEUROLOGICAL, LESION, ACHALASIA (8077)
  - NEUROMUSCULAR MECHANISM, ESOPHAGEAL HISTOLOGY, RADIOLOGY (8068)
- ACID
  - PEPSIN, ACUTE ESOPHAGITIS MODEL (8055)*
- ADENOCARCINOMA
  - APPENDIX, PSEUDOMYXOMA PERITONEI, NEURAMINIDASE (8208)
  - EXCLUDED LOOP OF ILEUM, REGIONAL ILEITIS, SURGERY (8163)
- ALBUMIN
  - DEGRADATION, IRRADIATION, PERFUSED INTESTINE (7988)
  - SYNTHESIS, LIVER, DISTRIBUTION (7890)*
- ALCOHOL
  - LIVER INJURY, CIRRHOSIS, DIABETES, CCL4 (8316)*
- AMEBIASIS
  - INTESTINAL, METRONIDAZOLE TREATMENT (8501)
- AMINO ACID
  - CATABOLISM, ENZYMES, LIVER (7893)*
- AMYLASE
  - ACUTE PANCREATITIS, EDEMA, NECROSIS (8257)
- ANASTOMOSIS
  - COMMON BILE DUCT, MICROSURGERY, DOG (8404)
  - ESOPHAGEAL PROSTHESIS, THORACIC SEGMENT, DOG (8056)
  - PORTACAVAL, INFECTION, FAILURE (8430)
- ANEURYSM
  - SPLENIC ARTERY, UPPER GASTROINTESTINAL BLEEDING, SURGERY (8476)
- ANTIBIOTIC
  - RESISTANT SHIGELLA, EPIDEMIC, CENTRAL AMERICA (8463)
  - TETRACYCLINE, FATTY LIVER (8333)
- ANTIBODY
  - DESTRUCTION, INTESTINAL JUICE, PROTEINASE INHIBITOR (7983)*
  - FECES, IMMUNIZATION, RABBIT (7985)*
  - FLUORESCENT, SCHISTOSOMIASIS, EVOLUTION (8485)*
- ANTIGEN
  - AUSTRALIA, HEPATITIS, ACUTE VIRAL (8353)
- ANUS
  - ANAL CANAL, SQUAMOUS CELL CARCINOMA, MELANOMA (8184)
  - IMPERFORATE, ADULT, SURGERY (8195)
- APPENDIX
  - MUCINOUS ADENOCARCINOMA, PSEUDOMYXOMA PERITONEI NEURAMINIDASE (8208)
- ASCITES
  - CHRONIC, PANCREAS, PSEUDOCYST (8243)*
- ATRESIA
  - ANUS, ADULT, SURGERY (8195)
  - GASTRIC ANTRUM, SURGERY (8097)
- BACTERIA
  - DIAGNOSTIC PROCEDURE, FLUORESCENT IMMUNOTEST, ENTEROPATHOGENIC COLI (8017)
  - E. COLI, ENTEROPATHOGENIC, DIARRHEA (8424)*
  - E. COLI, INTESTINAL PENICILLIN RETENTION, GUINEA PIG (7848)
  - E. COLI, GASTROENTERITIS, ANTIBIOTICS, INFANTS (8435)
  - GRAM NEGATIVE, SEPSIS, PERITONITIS (8152)
  - MYCOBACTERIA, FECES, MAN (8000)
  - SMALL INTESTINE, PATHOPHYSIOLOGY, MAN (8466)
- BACTERIAL DISEASE
  - SALMONELLOSIS, SALMONELLA TYPHIMURIUM ROUGH MUTANT (8422)*
- BILE
  - ACUTE PANCREATITIS, PATHOGENESIS (8244)
  - EXCRETION, CONTRAST MEDIA, PLASMA PROTEIN BINDING (7826)*
  - EXCRETION, STEROID HORMONES, MAN (7837)
  - FLOW, INTESTINAL PHASE, REGULATION (7883)*
  - MICELLE UPTAKE, IMIPRAMINE, DESMETHYLIMIPRAMINE, METABOLISM (7944)

- PROTEINS, GALLSTONES, ANTISERA (8396)•
- SUSPENSION, GALLSTONE (8395)•

BILE ACID
- ABNORMAL METABOLISM, CIRRHOSIS (8381)
- CHOLESTEROL, NEOMYCIN, COLCHICINE (8374)•
- LIPID, FECAL EXCRETION, CHOLERESIS (8307)

BILE DUCT
- ASCARIASIS, PANCREATITIS, DIAGNOSIS, TREATMENT (8495)
- AUTOLOGOUS, VENOUS PROSTHESIS, VENOUS DUODENAL ANASTOMOSIS, DOG (8403)
- CICATRICIAL STENOSIS, SURGERY, COMPLICATIONS (8409)
- STONE REMOVAL, EXTRAPERITONEAL PROCEDURE (8418)

BILIARY TRACT
- CHOLANGITIS, SCLEROSING, STEROID (8401)
- GALLSTONE, FATTY ACID-CALCIUM, HISTOCHEMISTRY (8398)•
- OBSTRUCTION, SGOT, LACTATE DEHYDROGENASE (8397)•
- OBSTRUCTIVE CIRRHOSIS, CASE REPORT (8372)•
- SURGERY, CHOLELITHIASIS, BILE DUCT CANCER, SOUTH VIETNAM (8413)

BILIRUBIN
- HYPERBILIRUBINEMIA, ALBUMIN, FREE FATTY ACIDS (7889)•
- METABOLISM, TRANSFER, CONJUGATION, GLUCORONYL TRANSFERASE DEFICIENCY (7956)

BLOOD
- ALTERATIONS, LIVER DISEASE, VITAMIN B12 (8291)
- CLOTTING FACTORS, PROTEIN, CIRRHOSIS (8389)
- SCREENING, AUSTRALIA ANTIGEN, VIRAL HEPATITIS (8363)
- TRANSFUSION, SERUM HEPATITIS, EPIDEMIOLOGY, GAMMA GLOBULIN CONTROL (8361)

BLOOD FLOW
- INTESTINE, CAPILLARY AND NEURO-CELLULAR RELATIONS, MATHEMATICAL ANALYSIS (8002)

BLOOD VESSEL
- ARTERY, LIGATION, LIVER, RIGHT LOBE METASTASES, COLONIC CANCER (8450)
- CELIAC ARTERY, NONATHEROMATOUS STENOSTENOSIS, PHYSIOPATHOLOGY (8427)
- MESENTERIC VEIN, INFARCT, SMALL INTESTINE, RESECTION (8456)
- MESENTERY, VASOCONSTRICTOR INFUSION, GASTROINTESTINAL BLEEDING (8441)
- SPLENIC ARTERY ANEURYSM, UPPER GASTROINTESTINAL BLEEDING, SURGERY (8476)
- VEIN, BILE DUCT REPLACEMENT, DOG (8403)
- VISCERAL ARTERIES, STENOSIS, OBSTRUCTION (8431)

CALCIUM
- DEFICIENCY, MALABSORPTION, VITAMIN B12 (8174)

CANCER
- ANUS, ANAL CANAL, SQUAMOUS CELL, MELANOMA (8184)
- GALLBLADDER, EPITHELIAL ALTERATIONS (8408)
- GASTRIC, 5-FLUOROURACIL PERIPHERAL BLOOD MORPHOLOGY (8125)
- GASTROINTESTINAL, CHEMOTHERAPY, 5-FLUOROURACIL (8436)
- GASTROINTESTINAL, COMBINATION CHEMOTHERAPY (8443)
- PRIMARY, LIVER, GALLBLADDER, ORTHOTOPIC AND HETEROTOPIC LIVER HOMOGRAFTS (8302)
- PRIMARY, LIVER, HEPATOMA, CHOLANGIOMA (8310)
- SIGMOID, VISCERA, COLLAGENOSES, IMMUNOLOGY (8472)
- STOMACH, INCIDENCE, SURGERY, MORTALITY RATE (8110)

CARBOHYDRATE
- METABOLISM, GLYCOLYSIS, PENTO PHOSPHATE SHUNT, HEPATOMA (8295)

CARCINOGEN
- LIVER, 4-DIMETHYLAMINOAZOBENZENE, HISTOCHEMISTRY (8282)

CARCINOGENESIS
- DIACETAMIDOFLUORENE, LIVER, RESERPINE INHIBITION, MOUSE (8305)
- LIVER, DIETHYLNITROSAMINE, SORBITOL DEHYDROGENASE, RAT (8297)
- LIVER, DNA SYNTHESIS, AZO DYE (7902)•
- LIVER, REGENERATION, NUCLEAR DNA TRANSFER (7974)

CARCINOMA
- ARGENTAFFIN, MESENTERIC CIRCULATION, SCLEROSIS (8151)
- CECUM, ABDOMINAL WALL, PROGNOSIS (8276)
- COLON, RECTUM, POLYPS (8202)
- COLON, SURGERY, SUBCUTANEOUS EMPHYSEMA (8195)
- COLON PERFORATION, RADIOGRAPHY, COLOSTOMY (8201)
- COLORECTAL, METASTASIS, LYMPH NODES (8196)
- ESOPHAGUS, RADIATION THERAPY, ESOPHAGOGASTRECTOMY (8083)
- GALLBLADDER, EXTRAHEPATIC BILE DUCT (8402)
- GASTRIC, ENZYMES, PROGNOSIS (8087)•
- HEPATOCELLULAR, DNA-LIKE RNA, CYTOPLASM (8265)•
- PANCREAS, EARLY DIAGNOSIS, SURGERY (8239)
- RECTUM, SURGERY, ENDORECTAL RESECTION (8183)
- SMALL INTESTINE, SARCOMA (8149)
- STOMACH, ESOPHAGEAL STENOSIS, PROSTHESIS (8060)
- STOMACH, HISTOPATHOLOGY, SECRETION (8086)•
- STOMACH, MORPHOLOGY, SURGERY, LIFE EXPECTANCY (8127)
- OBSTRUCTIVE, COLON, CECOSTOMY (8182)

CECUM
- CARCINOMA, ABDOMINAL WALL, PROGNOSIS (8276)

  - PERFORATION, ADYNAMIC ILEUS, INTESTINAL DISTENSION (8194)
  - VOLVULUS, ETIOLOGY, DIFFERENTIAL DIAGNOSIS (8193)
- CELIAC AXIS
  - CHRONIC STENOSIS, AORTOGRAPHY, SURGERY (8453)
  - EXTRINSIC STENOSIS, SURGERY, MOTILITY (8452)
  - STENOSIS, VISCERAL ANGIOGRAPHY, SURGERY (8451)
- CELL
  - ACINAR, PANCREAS, PENTAGASTRIN, RAT (8309)
  - ACINAR, PANCREATITIS (8260)
  - DAMAGE, LIVER, RAT, RABBIT (8339)
  - GROWTH INHIBITION, LIVER EXTRACT, MAN (7955)
  - ISOLATED INTESTINAL, METABOLISM (7986)*
  - MEMBRANE POTENTIAL, IONIC CONCENTRATIONS, PERFUSED LIVER (7838)
  - NUCLEAR HISTONE SYNTHESIS, LIVER REGENERATION, RAT (7954)
- CHOLANGIOGRAPHY
  - DIAGNOSTIC PROCEDURE, GALLBLADDER, GALLSTONE (8018)
  - INTRAVENOUS, DRIP INFUSION TECHNIQUE, BILIGRAFIN FORTE (8036)
  - OPERATIVE, CHOLEDOCHOPANCREATIC REFLUX, CHRONIC CHOLECYSTITIS (8041)
- CHOLANGITIS
  - ACUTE, EARLY DIAGNOSIS, BACTEREMIA, LIVER ABSCESS (8419)
  - PRIMARY SCLEROSING, STEROID (8401)
- CHOLECYSTECTOMY
  - BILIARY, ALCOHOLIC, VASCULAR, PANCREATITIS, SERUM AMYLASE (8253)
  - HEPATIC ARTERY ANEURYSM, OBSTRUCTIVE JAUNDICE, ACUTE HEPATITIS (8414)
- CHOLECYSTITIS
  - CHOLELITHIASIS, VAGAL STASIS, VAGOTOMY DOG (8416)
  - CHRONIC, OPERATIVE CHOLANGIOGRAPHY, CHOLEDOCHOPANCREATIC REFLUX (8041)
  - GALLBLADDER EMPHYSEMA, RADIOLOGY, CLINICAL FEATURES (8399)
  - WATER BALANCE, ELECTROLYTE BALANCE, SURGERY (8410)
- CHOLEDOCHOLITHIASIS
  - BILIARY TRACT SURGERY, BILE DUCT CANCER, SOUTH VIETNAM (8413)
  - ETIOLOGY, DIAGNOSIS, CHILDREN (8415)
  - EXTRAPERITONEAL PROCEDURE (8418)
  - GALLBLADDER, GALLSTONES, DIET (8400)
  - GALLBLADDER CYTOCHEMISTRY, HISTOLOGY, CHOLEDOCHOLITHIASIS (8406)
  - LIVER CELL NECROSIS, GRANULOCYTE, INFILTRATION, SURGERY (8298)
  - SPONTANEOUS RUPTURE, GALLBLADDER, CHOLECYSTECTOMY (8417)
- CHOLEDOCHUS
  - END-TO-END ANASTOMOSIS, MICROSURGERY, DOG (8404)
- CHOLERA
  - VIBRIO ENDOTOXINS, LIVER MITOCHONDRIA, KREBS CYCLE INTERMEDIATES (7978)
- CHOLERESIS
  - DRUG-STIMULATED, EXCRETION, BILE ACID, LIPIDS (8307)
- CHOLESTASIS
  - LIVER, HEPATOSIS, TREATMENT (8290)
  - LIVER, THERAPY (8289)
  - ULCERATIVE COLITIS (8216)
- CHOLESTEROL
  - LIVER, CANCER, MOUSE (8276)
- CHOLINE
  - DEFFICIENCY, BIOSYNTHESIS, PHOSPHATIDYL CHOLINE (7962)
  - DEGRADATION, ANTIBIOTICS, COPROPHAGY (7991)*
- CIRCULATION
  - ACUTE GI BLEEDING, CENTRAL VENOUS PRESSURE (8425)*
  - BLOOD VESSEL, LIVER, VEIN, INNERVATION (7996)
  - ENTEROPATHY, GAS, PORTAL VEIN (8142)*
  - HEPATIC BLOOD FLOW, DRUG EFFECTS, CHOLERESIS (7924)
  - LIVER INJURY, INTRAHEPATIC SHUNT (8321)*
  - LYMPHATICO-VENOUS SHUNTS, LYMPHANGIOMA MESENTERY (8464)
  - MESENTERIC ARGENTAFFIN CARCINOMA, SCLEROSIS (8151)
  - OCCLUSION, X-RAY DIAGNOSIS, COLOSTOMY, CECOSTOMY (8444)
- CIRRHOSIS
  - BILIARY, LIVER, HISTOLOGY, IMMUNOLOGY (8387)
  - COMPENSATED, LIVER, INDOCYANINE-GREEN TEST (8016)
  - LIVER, BILE ACIDS, ABNORMAL METABOLISM (8381)
  - LIVER, CYTOCHEMISTRY, CHILDREN (8388)
  - LIVER, ENTEROHEPATIC CIRCULATION, ERYTHROCYTES (8394)
  - LIVER, EPIDEMIOLOGY, ETIOLOGY (8377)
  - LIVER, ETIOLOGY, HISTOLOGY (8384)
  - LIVER, HEMORRHAGE, TREATMENT (8379)
  - LIVER, HEPATIC MYELOPATHY, ANATOMOPATHOLOGY (8380)
  - LIVER, KALA-AZAR INFECTION (8393)
  - LIVER, ORNITHINE-ASPARTATE MIXTURE, BLOOD AMMONIA LEVELS (8390)
  - LIVER, PATHOLOGY, IMMUNOLOGY (8386)
  - LIVER, PORTAL, NITROGEN METABOLISM (8375)*
  - LIVER, SYMPTOMATOLOGY, THERAPY (8392)
  - LIVER, UMBILICAL VEIN CATHETERIZATION, PERITONEOTOMY (8385)
  - LIVER, VENOUS PRESSURES (8371)*
  - LIVER, VIRAL HEPATITIS, SERUM LIPOPROTEINS (8266)*
  - LIVER, ZINC, COLLAGEN (8369)*
  - LIVER INSUFFICIENCY, PATHOLOGY, BIOCHEMISTRY (8393)
  - LIVER MORPHOLOGY, CHRONIC HEPATITIS, VIRAL HEPATITIS (8391)
  - LIVER SLICES, ALBUMIN SYNTHESIS (8373)*
  - OBSTRUCTIVE BILIARY, LIVER INJURY, ATRESIA (8372)*

- THIOACETAMIDE INDUCED, LIVER, DEHYDROGENASES, HISTOCHEMISTRY (8382)

COENZYME
- Q, LIVER MITOCHONDRIA, HYPERTHYROIDISM (7909)*

COLITIS
- GRANULOMATOUS, THERAPY (8224)
- ISCHEMIC (7846), (8206)
- NON-NECROTIZING, REGIONAL, SEGMENTAL (8180)*
- REGIONAL, GRANULOMATOUS (8220)
- ROENTGENOLOGY, SEGMENTAL, GRANULOMATOUS (8219)
- SEGMENTAL, GRANULOMATOUS (7960)
- TRANSMURAL, CHRONIC ULCERATIVE (8221)
- ULCERATIVE, AGE, SEX, RELAPSE (8211)*
- ULVERATIVE, ETIOLOGY, THERAPY (8215)
- ULCERATIVE, MICROFLORA, LARGE INTESTINE, FECES (8212)
- ULCERATIVE, POLYARTHRITIS, SACROILEITIS (8214)

COLON
- CARCINOMA, PRIMARY LINITIS PLASTICA (8190)
- CARCINOMA, SURGERY, SUBCUTANEOUS EMPHYSEMA (8185)
- CECUM, MORPHOLOGY, RODENTS (7805)
- DISEASE, GUAR GUM THERAPY, ATAPULGITE (8203)
- DIVERTICULITIS, HEMORRHAGE, SURGERY (8198)
- DIVERTICULOSIS, SURGERY (8197)
- FISTULA, GALLBLADDER, MALABSORPTION (8412)
- MORPHOLOGY, JEJUNAL RESECTION (7808)
- MUCOSA ANTIGENS, PHOSPHATASES, MAN (7821)
- OBSTRUCTIVE CARCINOMA, CECOSTOMY (8182)
- PERFORATION, CARCINOMA, RADIOGRAPHY, COLOSTOMY (8201)
- ULCERATIVE, GRANULOMATOUS, MICRODIVERTICULA (8156)*

CONSTIPATION
- FUNCTIONAL GASTROINTESTINAL DISEASES, DRUG TREATMENT, AGE (8446)

CORTICOSTEROID
- URINARY EXCRETION, HYDROCORTISONE, VIRAL HEPATITIS (8350)

CROHN,S DISEASE
- COLON, THERAPY (8224)
- ILEUM, COLON, RECTUM, ANUS (8159)
- PATHOPHYSIOLOGY, DIAGNOSIS, ANTIMETABOLITE THERAPY (8164)
- PERITONITIS, INTESTINAL PERFORATION (8158)

CULTURE
- SMALL INTESTINE, VIRUS MULTIPLICATION, HUMAN EMBRYO (7998)

CYST
- FALSE, PANCREAS, COLON INVOLVEMENT, INTESTINAL OCCLUSION (8231)

CYTOPLASM
- LIVER, PROTEIN, HEMOGLOBIN SYNTHESIS, RABBIT (7800)

DIAGNOSIS
- CARCINOMA, PANCREAS HEAD (8241)
- COMPENSATED, CIRRHOSIS, INDOCYANINE-GREEN TEST (8016)
- DIFFERENTIAL, ANGIOGRAPHY, PANCREATITIS, CARCINOMA (8034)
- DIFFERENTIAL, JAUNDICE, ETIOLOGY (8031)
- GASTRIC DILATATION, PREVENTIVE MEASURE (8046)
- INTESTINAL GAS, RADIOLOGIC APPEARANCE (8010)*
- LIVER TRAUMA, TREATMENT (8028)
- PANCREAS CARCINOMA, SELENO METHIONINE SCANNING (8039)
- PANCREAS TUMOR, SELENOMETHIONINE SCAN, DIARRHEA, HISTOLOGY (8238)
- PANCREATIC INJURY, SERUM AMYLASE, LAPARATOMY (8237)
- RADIOISOTOPE SCANNING, LIVER, REGENERATION (8280)
- ROENTGEN, PEPTIC ULCER, GASTRIC, DUODENAL, PYRILENE TEST (8043)

DIAGNOSTIC PROCEDURE
- ABDOMINAL, EXPLORATORY, LAPARATOMY, INDICATIONS (8032)
- ABSORPTION TESTS, MALABSORPTION, ETIOLOGY (8052)
- AMEBIASIS, SKIN TEST (8021)
- CHOLECYSTOGRAPHY, CODEINE, SPHINCTER OF ODDI (8047)
- COLITIS, SEGMENTAL, GRANULOMATOUS (8219)
- DISACCHARIDE ABSORPTION, LACTOSE INTOLERANCE, LACTASE ACTIVITY (8177)

TUMOR, BLOOD SUPPLY (8263)*
TUMOR, MICROSOMES, MITOCHONDRIA, LIPIDS (8287)
UDP-GLUCURONIC ACID PYROPHOSPHATASE, HOMOGENATE, MICROSOMES (7776)*
ULTRASTRUCTURE, GOLGI, ELECTRON MICROSCOPY (7798)*
VEIN, INNERVATION, CAT, DOG (7996)
VIRAL HEPATITIS, IMMUNOGLOBULIN LEVEL, DIAGNOSIS (8035)
PERFUSED, AMPHETAMINE REMOVAL, MONOAMINE OXIDASE INHIBITORS, CAT (7940)
PERFUSED, TYROSINE AMINOTRANSFERASE, HYDROCORTISONE INDUCTION, HISTONES (7936)

LIVER DISEASE
  BLOOD ALTERATIONS, VITAMIN B12 (8291)
  CHRONIC, SCANNING, RADIOACTIVE COLLOIDAL GOLD (8020)
  HEPATITIS, HALOTHANE, LYMPHOCYTE (8326)*
  METABOLAN (8292)

LYMPH CIRCULATION
  LYMPHANGIECTASIS, INTESTINAL (8460)

LYMPHANGIECTASIA
  INTESTINAL, CHYLOUS ASCITES, WALDMANN DISEASE (8471)

LYSOSOME
  LIVER, ADRENALECTOMY, RAT (7818)

MALABSORPTION

- CHOLECYTOCOLONIC, FISTULA (8412)
- DIAGNOSIS, ABSORPTION TESTS, ETIOLOGY (8052)
- DRUG INDUCED, CHOLESTYRAMINE, ANEMIA (8179)
- FAT, GLUCOSE, HYPERTONIC MANNITOL (8168)*
- HISTOPATHOLOGY, MUCOSA POUCHES, JEJUNUM (7853)*
- INTESTINAL, CALCIUM, VITAMIN B12 (8174)
- INTESTINAL, GLUTENENTEROPATHY, PANCREAS (8169)
- INTESTINE, CALCIUM LOSS, HYPOCALCEMIA (8172)
- LACTASE, GENETIC (8175)
- SMALL BOWEL BY-PASS, OBESITY, DIET (8178)

MALFORMATION
- GASTROINTESTINAL TRACT, THALIDOMIDE, RABBIT EMBRYO (8481)

MALNUTRITION
- MARASMUS, PANCREATIC EXOCRINE FUNCTION INFANTS (8426)

MEMBRANE
- ENZYMES, PLASMA, MICROSOMES, HEPATOMA (7802)
- JUNCTION, LIVER, ELECTRON MICROSCOPY (7797)*
- NUCLEAR, LIVER, LIPID COMPOSITION (7778)*
- NUCLEAR, PERMEABILITY, CIRCADIAN (7976)
- PERMEABILITY, LIVER CELL, NUCLEI (7975)

MESENTERY
- ACUTE INFARCT, SUPERIOR MESENTERIC ARTERY OCCLUSION, SYMPATHECTOMY (8445)
- CIRCULATION, ARGENTAFFIN CARCINOMA, SCLEROSIS (8151)
- FIBROMA, RECTOPOLYPOSIS (8200)
- INFARCTION, X-RAY DIAGNOSIS, VASCULAR OCCLUSION (8444)
- LIPODYSTROPHY (8173)
- LYMPHANGIOMA, MICROCIRCULATION, LYMPHATICO-VENOUS SHUNT (8464)
- SMALL INTESTINE, MICROCIRCULATION, HEMODYNAMICS (7997)

- VENOGRAPHY (7993)*

METABOLISM
- AMINO ACID, LIVER, DISORDERS (8262)*
- AROMATIC AMINES, DEMETHYLATION, PHENOBARBITAL, LIVER (7947)
- BILIRUBIN, TRANSFER, INTRAHEPATIC CONJUGATION, GLUCURONIDE TRANSFERASE (7956)
- CCl4, DRUG, FASCIOLA HEPATICA (8491)
- CHOLESTEROL, LECITHIN-CHOLESTEROL ACYLTRANSFERASE, LIVER DAMAGE (8318)*
- CHOLESTEROL, LIVER, HEPATECTOMY, RAT (7948)
- CHOLESTEROL, LIVER, PHENOBARBITAL (7932)
- CHOLESTEROL BIOSYNTHESIS, NEOMYCIN, LIVER, MAN (7887)*
- ETHANOL, LIVER MICROSOME, RAT (7888)*
- FLUORIDE, LIVER, GLYCOLYSIS, CITRIC ACID CYCLE (7914)*
- GLUCONEOGENESIS, PYRUVATE, PERFUSED RAT LIVER (7966)
- GLYCOREGULATION, GASTRECTOMY (8101)
- HYDROXYUREA, LIVER, MOUSE, UREA (7945)
- IMIPRAMINE, DESMETHYLIMIPRAMINE, BILIARY EXCRETION (7944)
- LIPID, CARBOHYDRATE, PROTEIN, IRON, GASTRECTOMY (8100)
- LIVER, CARNITINE ESTER (7970)
- LIVER, DAMAGE, HALOTHANE EFFECT (8344)
- LIVER, DRUGS, METHYLCHOLANTHRENE DERIVATIVES, RAT (7943)
- LIVER, ETHANOL, GLUCAGON (7972)
- LIVER, GLUCONEOGENESIS, HORMONAL CONTROL (7951)
- LIVER, GLYCOLYSIS, GLUCONEOGENESIS, DIABETES (7964)
- LIVER, LYSINE, COMPARTMENTATION (7771)*
- LIVER, RADIATION INJURY, RNA, ATP (8338)
- LIVER, RESPONSE, PORTACAVAL SHUNT (7905)*
- LIVER, XANTINOL NICOTINATE (7961)
- LIVER MITOCHONDRIA, CHOLINE, BETAINE (7896)*
- LIVER REGENERATION ENHANCEMENT, CO2 FIXATION, RABBIT (7981)
- N-METHYLCARBAMATES, LIVER, MAN, RAT (7942)
- TRANSFER RNA, METHYLATION, REGENERATION (M884)*
- TYROSINE, HEREDITARY FRUCTOSE INTOLERANCE, ALDOLASE (8313)
- URETHAN, HEPATECTOMY (7885)*
- WATER, ELECTROLYTE, CHOLECYSTITIS, SURGERY (8410)
- ZINC, GASTRIC AND DUODENAL ULCER (8133)

METAL
- CALCIUM, INTESTINAL MUCOSA, MITOCHONDRIA (7830)*
- CHROMIUM, ENTEROPATHY (8459)
- IRON, ABSORPTION, WHOLE-BODY COUNTING (7842)
- IRON ABSORPTION, GASTROINTESTINAL TRACT, COBALT (7832)*
- IRON ABSORPTION, NEOMYCIN, GERMFREE RATS (7829)*
- IRON-BINDING CAPACITY, PLASMA, ORAL OVERLOADING, NORMAL AND HYPERTHYROID PATIENTS (7847)

METASTASIS
- LIVER, BLOOD SUPPLY, TUMOR (8263)*

MICROSOME
- HEPATOTOXICITY, METABOLISM, CCl4, DIETHYLDITHIOCARBAMATE (8345)
- LIVER, ENZYME INDUCTION, CHLOROFORM, RETROSINE (8341)
- LIVER, ALIPHATIC HYDROXYLATION (7897)*
- LIVER, CYTOCHROME P-450, EPR, METHYLCHOLANTHRENE (7801)
- LIVER, DRUG METABOLISM, NICOTINAMIDE (7918)*

  - LIVER, HYDROXYLATION, CYTOCHROME P-450 (7921)•

PREFACE

GASTROENTEROLOGY ABSTRACTS and CITATIONS is a publication of the National Institute of Arthritis and Metaboli Diseases. This specialized information medium has been initiated to fill an existing great need in the field of gastroenterology and to assist the Institute in meeting its obligations to foster and support laboratory and clinical research into the nature, causes, and therapy of diseases of the gastrointestinal tract. Publication of GASTROENTEROLOGY ABSTRACTS and CITATIONS makes available citations of all current papers relevant to this field from medical journals published throughout the world. Approximately one-third of the citations dealing with the major aspects of gastroenterology have accompanying abstracts.

The issuing of GASTROENTEROLOGY ABSTRACTS and CITATIONS under the auspices of the National Institute of Arthritis and Metabolic Diseases will provide a much needed current awareness tool to scientists and will facilitate greater integration of research and clinical efforts in this field. The number and great diversit of publications in the area of gastroenterology makes it imperative that an appropriate service be available investigators and practitioners so that they may be apprised of progress with a minimum of delay. Our aim is to provide the readers with a readily systematized compilation of current published work. The publication will provide the greatest usefulness if these interested investigators will contribute their ideas and commen for consideration whenever possible.

GASTROENTEROLOGY ABSTRACTS and CITATIONS is published monthly and includes citations and abstracts from the biomedical world literature as they are currently received. In addition, yearly cumulated subject and autho indexes are published.

This publication is available free to National Institutes of Health grantees and contractors working in the field of gastroenterology and libraries of medical schools. Requests from these qualified individuals to receive free copies of this publication must include their grant or contract number and the title of their project. These requests as well as address changes and other communications should be addressed to:

Scientific Communications Office
Gastroenterology Abstracts and Citations
National Institute of Arthritis and Metabolic Diseases
National Institutes of Health
Bethesda, Maryland 20014

Other individuals and libraries may receive this publication by subscribing *directly* to the Superintendent o Documents, U.S. Government Printing Office, Washington, D.C. 20402. Subscription price per year in the United States, Canada, and Mexico, $16.00; foreign, $4.00 additional; and $1.25 for a single copy. Payment required in advance, and check or money order should be made payable to the Superintendent of Documents.

PRE-CLINICAL SCIENCES

MORPHOLOGY, CELLULAR STRUCTURE AND HISTOCHEMISTRY

8502 X-RAY DIFFRACTION AND ELECTRON-MICROSCOPE STUDIES OF THE BRUSH BORDER MEMBRANE OF GUINEA PIG INTESTINAL EPITHELIAL CELLS. *(E.)* Limbrick, A. R. (Duke U. Med. Ctr., Durham, N.C.) and J. B. Finean. *J Cell Sci* 7(2):373-386, 1970.

Low-angle X-ray diffraction and electron microscopy indicated that brush border membranes isolated from guinea pig intestinal epithelial cells condensed together to give a repeating unit of about 30 nm with 2 unit membrane features separated by a band of high density. Electron micrographs allowed identification of the high density band with the external surface of the microvillus membrane, and a probable model for the electron density profile of the double membrane repeating unit was constructed. The electron density profile of hydrated membranes suggested a lamellar membrane structure in which the low density region represented mainly hydrocarbon chains of a lipid layer; the peaks of the profile included lipid ionic end groups, associated metallic ions and nonlipid components. The presence of water in the membranes seems to be necessary for the maintenance of their integrity since any reduction of water below 30% induced changes in the diffraction patterns. No clear indication of any subunit structure within the plane of the membrane was noticed.

8503 THE SUBCELLULAR DISTRIBUTION OF TRIGLYCERIDE SYNTHETASE IN THE INTESTINAL MUCOSA. *(E.)* Schiller, C. M. (U. Texas Southwestern Med. Sch., Dallas), J. S. K. David and J. M. Johnston. *Biochim Biophys Acta* 210(3):489-492, 1970.

The subcellular distributions of sucrase, glucose-6-phosphatase and triglyceride synthetase were measured in microsomal fractions from the brush border of rat and hamster intestinal mucosa, in order to establish the possible contamination of microsomes with the brush border fraction and to assess possible contamination of the brush border fraction with microsomal membranes. The intestinal microsomes were prepared from a 10% intestinal homogenate in 0.1 M Tris-maleate buffer at pH 7.0 and the microsomal fraction was obtained by centrifuging the mitochondrial supernatant from the cell debris fraction at 104,000 x g for 30 min. The enzymes were assayed by previously reported procedures, and the specific activity of each enzyme was expressed in terms of µmoles/min/mg protein of product formed. In the case of the enzymes recovered from the hamster intestinal mucosa, the microsomal fraction employed in the purification of triglyceride synthetase was not contaminated with brush border membranes since less than 1% of the sucrase activity was present in this fraction. The specific activity of sucrase was 0.001 in the supernatant fraction, 0.002 in the microsomal fraction, 0.015 in the mitochondrial fraction, and 0.017 in the whole homogenate. The specific activities of glucose-6-phosphatase and of triglyceride synthetase were highest in the microsomal fraction, with values of 0.092 and 0.045, resp., compared with values of 0.001 and 0.000 in the supernatant fraction, and 0.058 and 0.015 in the mitochondrial fraction. In both rat and hamster intestinal mucosa, activities of glucose-6-phosphatase and triglyceride synthetase isolated in the brush border fraction reflected a contamination with microsomal enzymes.

8504 SUBSTRATE SPECIFICITY OF PANCREATIC LIPASE: INFLUENCE OF THE STRUCTURE OF FATTY ACIDS ON THE REACTIVITY OF ESTERS. *(E.)* Brockerhoff, H. (Fisheries Res Board Canada, Halifax Lab., Nova Scotia). *Biochim Biophys Acta* 212(1):92-101, 1970.

Porcine pancreatic lipase hydrolysis of various esters of monoenoic, polyenoic, methyl-branched, and ω-cyclohexyl or ω-phenyl substituted acids and also esters of aliphatic acids of various chain lengths was studied and compared to oleate esters. Substituents or unsaturation on C_{2-5} led to a relative resistance of the esters against lipase. *Cis* and *trans* unsaturation and the one triple bond tested inhibited lipolysis comparably; introduction of additional but more remote double bonds, as in marine polyenoic acids, introduced no additional resistance. Between unsaturation at $\Delta^{2,3}$ and $\Delta^{5,6}$, the resistance did not depend in a coherent manner on the actual position of the double bond; $\Delta^{2,3}$-acids or $\Delta^{4,5}$-acids may in fact be slightly better substrates than $\Delta^{5,6}$-acids. Compared to a monomethyl-branched acid, multiple branching introduced further resistance. Cyclohexylacetic acid was almost completely resistant but inhibition by ω-phenyl groups disappeared gradually as the chain was lengthened to carbon 6 and the ω-phenyl octanoates had an abnormally high rate of lipolysis, 2-3 times that of oleate. Lipolysis rates of esters of straight-chain saturated acids increased from C_2 to a maximum at C_4, decreased suddenly at C_5 and then increased until around C_9 the rates of the oleates were approached. The resistance of unsaturated or branched acids may be due to steric hindrance during the formation of the activated complex, and this hindrance disappears largely for structures after C_5. In the subtrate-enzyme complex the esters probably are fixed to the enzyme in a two-dimensional orientation along the axis carbonyl carbon-ether oxygen of the carboxyl ester group; fixation and activation of the substrate is probably achieved by hydrogen bonding to both carbonyl and ether oxygen and the leaving alkoxy group is received by a labile hydrogen of the enzyme.

8505 MITOCHONDRIA OF RAT LIVER: VARIATIONS IN GROSS CONFORMATION AND SIZE. *(E.)* Bahr, G. F. (Armed Forces Inst. Path., Washington, D.C.), E. Pihl, W. Engler and U. Mikel. *Cytobiologie* 2(2):163-187, 1970.

In order to study the physical properties of mitochondria, a detailed quantitative analysis of the heterogeneity of rat liver mitochondria was made using electron micrographs. A periodicity of length to width ratios was found suggesting distinct subpopulations. Quantitative and morphologic evidence supported the concept of gross mitochondrial conformational change, by which an oblong mitochondrion curls to a spherical and the reverse. A critical radius governing the mitochondria of comparable locations and functional states seemed to exist, and indicated the momentary optimal distance from the interior to the surface of the organelle through which exchange of metabolites proceeded in a normal mitochondrion. Growing mitochondria remained spherical under this condition (up to a diameter d = 2r); any addition of mass induced lengthening of one axis so that the critical radius was maintained. However, the subpopulation of mitochondria for which the critical radius was the determining factor constituted only a portion of the total mitochondrial population at a given tissue site determining its functionally active role. Mitochondrial conformation may be one of the mechanisms by which actively metabolizing mitochondrial mass is controlled.

8506 THE EFFECT OF CARRIERS ON THE PRODUCTION OF ANTIBODIES TO THE GASTRIN TETRAPEPTIDE. *(E.)* Jaffe, B. M. (Washington U. Sch. Med., St. Louis, Mo.), W. T. Newton and J. E. McGuigan. *Immunochemistry* 7(8):715-725, 1970.

The C-terminal tetrapeptide amide of gastrin was antigenic only when conjugated to serum protein carriers; conjugates with poly-L-lysine and poly-L-glutamic acid evoked no antibodies to the tetrapeptide moiety. The immunoreactivity of four gastrin tetrapeptide congeners (gastrin tetrapeptide, gastrin pentapeptide, human gastrin, and cholecystokinin-pancreozymin) was evaluated by examining the ability of equimolar quantities of the congeners to inhibit the reaction between anti-tetrapeptide antibody and either ^{125}I-gastrin or a radioiodinated conjugate of gastrin tetrapeptide and a copolymer of glutamic acid, alanine and tyrosine. When ^{125}I-gastrin was the label, gastrin was the most effective inhibitor and tetrapeptide the least effective; with the ^{125}I-copolymer-tetrapeptide conjugate, the most effective inhibitor was the tetrapeptide sequence. For each labeled detector a defined series of parallel inhibition plots were noted (in which the homologous inhibitor was the most effective) which could be extrapolated to total inhibition.

8507 DISTRIBUTION OF RENNIN IN THE CALF STOMACH: IMMUNOHISTOCHEMICAL STUDY. *(E.)* Nagakubo, I. (Sch. Med. Keio U., Tokyo, Japan), K. Takano, T. Suzuki and K. Yasuda. *Okajima Folia Anat Jap* 47(2-3):151-157, 1970.

Precise localization of rennin in the calf stomach was accomplished using immunofluorescence. Rennin was not found in the first (rumen), second (reticulum), or third (omasum) stomachs, but was localized in the gastric gland of the fourth (abomasum) stomach. Rennin was distributed throughout the gland with the material concentrated in the supranuclear and apical cytoplasm of the cells at the bottom of the gland and in the body and neck of the gland. Towards the surface epithelium, the cells with intense fluorescence increased in number and most of the tall columnar epithelial cells contained large amounts of rennin. The presence of rennin was not confirmed in the lumen of the gastric gland or in the foveolae of the surface epithelium.

8508 INTESTINAL MUCOSAL LYMPHATIC PERMEABILITY: AN ELECTRON MICROSCOPIC STUDY OF ENDOTHELIAL VESICLES AND CELL JUNCTIONS. *(E.)* Dobbins, W. O., III (VA Hosp., Washington, D. C.) and E. L. Rollins. *J Ultrastruct Res* 33(1-2):29-59, 1970.

The route of passage of water-soluble macromolecules across lacteals of intestinal villi of mice and guinea pigs was determined by using peroxidase, ferritin, and chylomicrons as tracers; saline-injected animals served as control. Lacteal junctions were classified as close junctions, tight junctions, open junctions, and indeterminate junctions. In lacteals there were 10 close junctions, 89 tight junctions, 6 open junctions, and 149 indeterminate junctions. Ferritin and peroxidase were frequently identified within pinocytotic vesicles. Peroxidase (diameter about 50 Å) was seen within close junctions but did not appear to penetrate tight junctions, and ferritin (diameter about 110 Å) did not penetrate either tight or close junctions. Chylomicrons (diameter about 2000 Å) did not penetrate close or tight junctions, were occasionally seen in large vesicles, and were often identified within overlapping endothelial cell processes. The major route of transport of these substances across lacteals of the intestinal mucosa is apparently vesicular rather than through endothelial cell junctions.

8509 THE EFFECT OF GLUCAGON ON THE STATE OF LYSOSOMAL ENZYMES IN ISOLATED PERFUSED RAT LIVER. *(E.)* Guder, W. (Munich Hosp., Germany), J. Frohlich, C. Patzelt and O. Wieland. *FEBS Letters* 10(4):215-218, 1970.

The ketogenic and ureogenic action of glucagon in the isolated perfused rat liver was correlated to the formation of autophagic vacuoles, and was measured by determination of lysosomal enzymes under isotonic conditions (free activity) and after disruption of lysosomes (total activity) in livers from 24-hr fasted rats. Rat livers were preperfused with wasted human red cells in a buffered albumin solution and then were treated with a single dose of 200 mg of glucagon. Lysosomal triglyceride lipase was measured by determination of glycerol release from triolein at pH 6.0, and N-acetyl-β,D-glucosaminidase was tested by a previously reported method. Free activity of the enzymes N-acetyl-β, D-glucosaminidase and triglyceride lipase increased after glucagon, but total activity (which was measured at the end of the perfusion) showed no difference between the control and the glucagon-treated livers. The free activity of both enzymes rapidly increased by 40% of the initial value within 15 min after addition of glucagon to the perfusion system. Glucagon produced rapid increase in urea production from a control value of 0.159 µmoles/g/min to 0.275, and in ketogenesis from a control value of 0.384 µmoles/g/min to 0.525.

8510 PROLIFERATION KINETICS IN EPITHELIUM OF GUINEA-PIG COLON: I. VARIATIONS DEPENDING ON CRYPT LENGTH AND ITS LOCALIZATION. *(E.)*

Sawicki, W. (Sch. Med. Warsaw, Poland) and J. Rowinski. *Cell Tissue Kinet* 3(4):375-383, 1970.

The kinetics of proliferation of crypts of guinea pig colon were studied autoradiographically with ^{3}H-thymidine in crypts situated in the top and the basal parts of the fold, and in the lower and in the upper parts of an individual crypt. Crypts situated in the top region of folds were significantly longer than those situated in the basal region, and the duration of cell cycle and its phases were similar in the crypts of the two regions examined. The rate of ^{3}H-thymidine uptake was higher in the middle than in the initial and final parts of the S phase, and its pattern was the same for the crypts of the two regions of the fold as well as for the parts of the individual crypt. The proliferating pool size was larger in crypts situated in the top than in the basal region of the fold, and larger in the lower parts of crypts from each region than in the upper parts. Control of cellular proliferation in the crypt epithelium is considered to operate separately at the level of the individual crypt and at the level of a group of crypts situated in a given region of the colonic wall.

8511 ULTRASTRUCTURAL CHANGES AFTER PERFUSION OF ISOLATED RAT LIVER WITH A FLUOROCARBON EMULSION AS A SUBSTITUTE FOR ERYTHROCYTES. *(E.)* Ruigrok, T. J. C. (Biol. Ultrastruct. Res. Unit, St. U. Utrecht, Netherlands) and P. F. Elbers. *Cytobiologie* 2(2):315-325, 1970.

Ultrastructural changes in rat liver were studied after perfusion with emulsions of a fluorocarbon FC-75 in Tyrode solution, which was used as a substitute for erythrocytes because of its high capacity for oxygen and carbon dioxide solvation. With bovine serum albumin as the emulsifying agent massive phagocytosis of emulsion droplets could be observed in the Kupffer cells, presumably due to the fact that the droplets were covered by a foreign protein. With the nonionic detergent F 68 instead of albumin the rate of flow of the emulsion through the liver decreased rapidly. The micrographs show an obstruction of the sinusoids because the endothelial cells loose their attachment with the hepatocytes at several places. By using the detergent as emulsifier and bovine albumin as an oncotic agent the above effects were avoided. After 60 min of perfusion with this medium, flow rate and bile production were still normal, and at that time only a part of the Kupffer cells contained emulsion droplets; no ultrastructural alterations attributable to hypoxia could be found.

8512 EFFECTS OF AMINOACRIDINES AND RELATED COMPOUNDS ON THE CONFORMATION OF RAT LIVER RIBOSOMES. *(E.)* Hultin, T. (Wenner-Gren Inst., Stockholm, Sweden). *Chem Biol Interaction* 2(2):61-77, 1970.

Inhibition of rat liver ribosomal peptide bond formation was studied by inducing a conformational reaction with aminoacridines and a number of other positively charged planar heterocyclic compounds (atebrin, toluidine blue, harmine, pyronine) with intercalating activity. The reaction involved a specific alteration in the pattern of structural shielding of ribosomal proteins depending on the flatness and positive charge of the added polycyclic compounds. The conformational effect was strictly temperature dependent (inflection at 25°C with atebrin) and was influenced by the ionic composition of the medium. Reversible selective unmasking of a previously resistant protein ("protein 10") occurred reaching a maximum at KCl concentrations above 0.7 M when intercalating agents were no longer needed for unmasking at 35°C. "Protein 10," located in the larger subunit, thus became accessible to molecular probes (chymotrypsin, thermolysin). Selective unmasking seemed to be related to an intercalative deformation of RNA-helices, while unspecific reactions were probably due to a more general interference of positively charged aromatic compounds with the tertiary RNA structure. Reversibility of induced alterations was correlated with the ability of treated ribosomes to regain their capacity of amino acid incorporation.

8513 UNEQUAL RATES OF DEVELOPMENT OF MITOCHONDRIAL ENZYMES IN RAT SMALL INTESTINAL EPITHELIUM. *(E.)* Hulsmann, W. C. (Rotterdam Med. Sch., Netherlands), W. G. J. Iemhoff, J. W. O. Van Den Berg and A. M. De Pijper. *Biochim Biophys Acta* 215(3):553-555, 1970.

Enzyme activities of mitochondria isolated separately from villous and crypt epithelium (method of Harrison and Webster) of rat jejunum were compared. The rates (nmoles substrate oxidized/mg protein/min) of succinate and glycerol-1-phosphate oxidation were greater in the villous mitochondria (223 and 52, resp.) than in the crypt mitochondria (96 and 12, resp.); acetoacetate oxidation was greater in crypt mitochondria (2.5) than in villous mitochondria (0.2), and β-hydroxybutyrate oxidation was similar in both crypt and villous mitochondria (8.7 and 6.1, resp.). Histochemical examination of mitochondrial glycerol-1-phosphate dehydrogenase and succinate dehydrogenase in crypts and villi revealed different rates of development with glycerol-1-phosphate dehydrogenase virtually absent in the crypts and succinate dehydrogenase present in both but with a higher activity in the villi.

8514 THE ULTRASTRUCTURE OF LIVER CELLS IN WOMEN UNDER STEROID THERAPY: I. NORMAL PREGNANCY AND TROPHOBLASTIC GROWTHS. *(E.)* Gonzalez-Angulo, A. (Natl. Med. Ctr., I.M.S.S., Mexico City, Mexico), R. Aznar-Ramos, H. Marquez-Monter, G. Bierzwinsky and J. Martinez-Manautou. *Acta Endocr* 65(2):193-206, 1970.

The ultrastructure of liver cells was studied in 5 healthy women during the last trimester when endogenous steroids are at their highest levels and in 7 women bearing trophoblastic growths in whom steroids are at their lowest levels but higher than in non-pregnant women. Liver biopsies from pregnant women revealed elongation, gigantism and lamellar osmiophilic matrical inclusions in approximately 10% of the population of mitochondria per cell examined. Liver biopsies of 6 women with hydatidiform mole and from 1 woman with choriocarcinoma revealed mild focal dilation and vesiculation of both rough and smooth endoplasmic reticulum; mitochondrial modifications were present and included gigantism, pleomorphism and also lamellar osmiophilic inclusions in 10-20% of the cases. In 1 case of hydatidiform mole, this change was observed in more than 60% of mitochondria examined. Variations in mitochondrial morphology and changes seen in the endoplasmic reticulum should not be regarded as pathological. Findings are seemingly an exaggeration of the physiological changes induced by an increased metabolic demand during pregnancy or else to a more direct effect of steroid hormones on liver cell organelles.

8515 THE ULTRASTRUCTURE OF LIVER CELLS IN WOMEN UNDER STEROID THERAPY: II. CONTRACEPTIVE THERAPY. *(E.)* Martinez-Manautou, J. (Natl. Med. Ctr., I.M.S.S., Mexico City, Mexico), R. Aznar-Ramos, J. Bautista-O'Farrill and A. Gonzalez-Angulo. *Acta Endocr* 65(2):207-211, 1970.

An electron microscope study was performed on liver biopsies of 14 young healthy women under different types of contraceptive therapy. Six women received an estrogen-free progestogen (chlormadinone acetate) daily in microdoses for 38-44 months, four women were given a combination of estrogen and progestogens (mestranol and norethindrone, ethinyl estradiol and norethindrone, mestranol and lynestrenol) for 63-104 months, and 4 were given sequential therapy (mestranol and chlormadinone, ethinyl estradiol and chlormadinone) for 1-67 months. Eight women had biopsies for control purposes. Moderate dilation and vesiculation of rough and smooth surfaced endoplasmic reticulum was observed in women receiving all types of therapy but more marked vesiculation was noted in women under sequential medication. Elongation of mitochondria with crystalloid inclusions in their matrices were found in 5-10% of whole population of mitochondria per cell in chlormadinone-treated women; similar changes were seen in 20-40% of the women treated with combined and sequential therapy. Mitochondrial modification in this last group was found in more than 60% of the cell population in one case. Fatty vacuolation was observed and was more marked with combined and sequential treatment. Mitochondrial changes are seemingly totally reversible and are thought to represent a response of the liver parenchymal cell in presence of steroid hormones.

ABSORPTION—EXCRETION—TRANSPORT

8548 ACTIVE TRANSPORT OF SODIUM BY HUMAN COLON *IN VITRO*. *(E.)* Grady, G. F. (Lemeul Shattuck Hosp., Boston, Mass.), R. C. Duhamel and E. W. Moore. *Gastroenterology* 59(4):583-588, 1970.

Unidirectional and net fluxes of sodium were measured isotopically in studies of planar segments of freshly resected human colonic mucosa "short-circuited" according to the technique of Ussing and Zerahn. Potential differences were the greatest when measurement in perfusion apparatus was performed soon after tissue resection (over 20 mV). The potential difference of tissue mounted within 30 min in the perfusion chamber averaged 18 mV (maximum, 23 mV) in contrast to a value of less than 10 mV when mounting required over 45 min. Potential differences declined asymptotically, reaching 50% of initial values approximately 90 min after mounting; decline in potential difference was unaffected by addition of glucose to perfusate. The transmural potential, short-circuit current, and sodium net flux showed parallel increases when antidiuretic hormone was added to the serosal perfusion solution, but application to the mucosa was ineffective. D-Glucose and L-alanine did not potentiate the short-circuit current, and oxygen deprivation or addition of 2,4-dinitrophenol sharply decreased the short-circuit current. Selected tissues with high initial potentials gave short-circuit current values of 3.2 $\mu Eq/hr/cm^2$ of tissue surface while the corresponding net flux of sodium was 4.0, a current to flux ratio of 0.8. Whether discrepancy between net flux and short-circuit current was methodological or due to asymmetrical ion fluxes other than sodium was not determined since measurements were not simultaneous. However, if allowance is made for the age of the *ex vivo* preparation, active transport of sodium exhibits the appropriate magnitude, direction and metabolite responses to account for most of spontaneous transmural potential and short-circuit current.

8549 GLYCINE TRANSPORT IN RABBIT ILEUM. *(E.)* Peterson, S. C. (Yale U. Sch. Med., New Haven, Conn.), A. M. Goldner and P. F. Curran. *Amer J Physiol* 219(4):1027-1032, 1970.

The transport of glycine from the mucosal solution across the brush border into the epithelial cells was studied in the rabbit ileum, and this unidirectional influx of glycine followed Michaelis-Menten type kinetics and was dependent on the Na^+ concentration in the mucosal solution. The maximal influx was unaffected by changes in Na^+ concentration, but the apparent Michaelis constant increased progressively from 22.7 mM at 140 mM Na^+ to 135 mM Na^+-free conditions. Simultaneous measurements of glycine and Na^+ influxes showed that glycine caused an increase in Na$^+$ influx; the ratio of the increment in the Na$^+$ influx to glycine influx varies from 0.97 at 140 mM Na$^+$ to 0.21 at 10 mM Na$^+$. Alanine, valine, leucine, and phenylalanine inhibited glycine influx competitively, indicating that all of these neutral amino acids enter the cell via the same mechanism. Glycine can also enter the cells to a small extent by a separate mechanism that can be inhibited by proline, but the capacity of this system is only 5% of the major pathway. Glycine influx appears to be consistent with the model originally proposed for alanine entry into the rabbit intestinal mucosal cell, suggesting that this model can be generalized to describe neutral amino acid entry.

8550 EFFECTS OF MONOVALENT CATIONS ON THE SODIUM-ALANINE INTERACTION IN RABBIT ILEUM: IMPLICATION OF ANIONIC GROUPS IN SODIUM BINDING. *(E.)* Frizzell, R. A. (U. Pittsburgh Sch. Med., Pa.) and S. G. Schultz. *J Gen Physiol* 56(4):462-490, 1970.

The interaction between Na$^+$ and alanine influx across the intestinal brush border was studied in isolated segments of distal ileum from New Zealand white rabbits, following increases in the mucosal solution concentrations of hydrogen, potassium and other monovalent cations. A change in the pH of the mucosal solution from pH 4.5 to pH 2.5 markedly inhibited the alanine influx across the brush border in the presence of Na, and this effect was reversed by subsequent exposure of pH 7.4. At pH 4.5, the alanine influx rate was 3.4 μmoles/hr/cm^2 and at pH 2.5, the influx measured 1.1 μmoles/hr/cm^2. In the absence of Na$^+$, alanine influx was not significantly decreased by lowering the pH of the test solution and an increase in the H$^+$ concentration from 0.03 to 3 mM did not affect influx in the absence of Na$^+$, but significantly inhibited influx in the presence of Na$^+$. In the absence of Na$^+$, addition of Li$^+$ (112 mM) enhanced the influx of alanine by 20%, while addition of 112 mM of K$^+$, Rb$^+$, or Ca^{++} produced no significant inhibition of alanine influx. Addition of Hg^{++}, mersalyl, Ag$^+$, Cu^{++} and UO$_2^{++}$ inhibited both Na$^+$-dependent and Na$^+$-independent fractions of alanine influx, while La^{+++} inhibited only the Na$^+$-dependent fraction. Alanine influx was inhibited by addition of 30 mM leucine at pH 2.5 in the presence and in the absence of Na$^+$. Anionic groups having a pKa of approximately 4 are involved in the interaction between Na$^+$ and the alanine-carrier complex.

8551 ABSORPTION OF VITAMIN B$_{12}$ BY THE GUINEA PIG: I. SUBCELLULAR LOCALIZATION OF VITAMIN B$_{12}$ IN THE ILEAL ENTEROCYTE DURING ABSORPTION. *(E.)* Peters, T. J. (Roy. Postgrad. Med. Sch., London, England) and A. V. Hoffbrand. *Brit J Haemat* 19(3):369-382, 1970.

Guinea pig intestinal mucosa was fractionated into subcellular components and vitamin B$_{12}$ was found to be predominantly localized to the inner mitochondrial membranes. In the fasted animal, the concentration of vitamin B$_{12}$ was similar in the jejunum and ileum and approximately 25% of 10 ng of ^{58}Co-cyanocobalamin given p.o. was retained after 7 days, when measured by a whole-body counting technique. In fasted guinea-pigs fed 8-11 ng of ^{57}Co-cyanocobalamin, radioactivity was present in the ileal mucosa within 1 hr of feeding, but no significant hepatic activity was present until 3 hr, confirming the presence of a mucosal delay in vitamin B$_{12}$ absorption, a characteristic finding of intrinsic factor mediated vitamin B$_{12}$ absorption. Seventy percent of the vitamin B$_{12}$ was found in the colon at 3 and 4 hr indicating that approximately 30% of the dose was absorbed. The ileal mucosa showed a highly significant rise in mitochondrial specific activity of labeled vitamin B$_{12}$ during the first 2 hr postfeeding, and subsequently decreased coincidentally with the rise in hepatic activity. The mitochondria may play a hitherto unsuspected role in vitamin B$_{12}$ absorption; since no significant lysosomal radioactivity occurred during the absorptive period, pinocytosis does not seem to be involved in vitamin B$_{12}$ absorption.

8552 RETENTION OF ORALLY ADMINISTERED ^{47}CALCIUM IN MAN UNDER NORMAL AND DISEASED CONDITIONS STUDIED WITH A WHOLE-BODY COUNTER TECHNIQUE. *(E.)* Sjoberg, H. E. (Karolinska Hosp., Stockholm, Sweden). *Acta Med Scand* (suppl. 509):1-28, 1970.

Whole body retention of ^{47}calcium (1-3 μc, p.o.) was measured in healthy subjects and in patients with endocrine and gastrointestinal diseases with and without osteopenia by a whole-body counting technique. Whole body ^{47}calcium retention after 14 days was 29.3% of the given dose for healthy subjects, was lower in patients with regional enteritis and partial resection of the small intestine (14.5%) and rheumatoid arthritis with osteopenia (21.1%), higher in patients after gastrectomy (44.4%), with primary hyperparathyroidism (39.8%), and acromegaly (39.7%), and normal in patients with pancreatic insufficiency (25.3%), Cushing's syndrome (24.4%), and postmenopausal osteoporosis (26.6%). Urinary excretion of ^{47}calcium over the 14 day period varied from 0.4 to 22.5% when the amount of stable calcium carrier was 135 mg, but there was a negative correlation between the carrier amount and the retention of calcium with a higher amount of calcium being retained with a higher carrier dose (675 mg).

8553 SODIUM, POTASSIUM, AND WATER CONTENT OF ISOLATED BULLFROG SMALL INTESTINAL EPITHELIA. *(E.)* Armstrong, W. McD. (Indiana U. Sch. Med., Indianapolis), D. L. Musselman and H. C. Reitzug. *Amer J Physiol* 219(4):1023-1026, 1970.

The content of water, Na$^+$, K$^+$ and volumes of distribution of mannitol-^{3}H and inulin-^{14}C were determined simultaneously in mucosal scrapings from strips of bullfrog small intestine incubated at 26 C in a sodium sulfate medium made isosmotic with mannitol. During the first 30-min immersion, tissue K$^+$ decreased significantly (43 ± 11 μEq/g wet weight), and tissue Na$^+$ increased (60 ± 10 μEq/g wet weight) compared to Na$^+$ and K$^+$ levels in freshly excised tissue (44 ± 7 and 53 ± 11 μEq/g wet weight, resp.). No further change in tissue Na$^+$ or K$^+$ or cell water, computed from inulin space and total tissue water, occurred between 30-min and 3-hr immersion. Mannitol appeared to enter the epithelial cells at a finite rate during immersion; compared with mannitol alone, D-galactose, 3-O-methylglucose, L-alanine, and L-valine caused increased (approximately 15%) cell water content. The latter also caused significant decreases in cell K$^+$ concentration but not in total cell K$^+$ content (except for galactose). D-Glucose and L-sorbose had no significant effect on cell water content or cellular electrolyte levels. D-Fructose caused an increase in cell water and in total cell K$^+$, but had no apparent effect on cell K$^+$ concentration.

8554 INTESTINAL ABSORPTION OF SUGARS, WATER AND SODIUM IN ALLOXAN DIABETIC RATS. *(E.)* Levinson, R. A. (U. Utah Coll. Med., Salt Lake City) and E. Englert, Jr. *Diabetes* 19(10):683-687, 1970.

The absorption of D-galactose, 3-methyl-D-glucose, D-xylose, sodium and water by the jejunum and ileum were studied *in vivo* in normal and alloxan diabetic rats. No consistent increase in sugar absorption was seen in diabetic over normal rats. Diabetic rats absorbed significantly more sodium and water than normals, probably on the basis of diabetes-induced dehydration, but the increased sodium absorption did not stimulate increased sugar absorption. Diabetic rats, as did normal rats, showed increased jejunal over ileal sugar absorption but salt and water absorption were not different between the intestinal segments.

8555 AN ELECTRON MICROSCOPIC LOCALIZATION OF CALCIUM IN THE SMALL INTESTINE OF NORMAL, RACHITIC AND VITAMIN D-TREATED RATS. *(E.)* Sampson, H. W. (Baylor U. Coll. Dent., Dallas, Tex.), J. L. Matthews, J. H. Martin and A. S. Kunin. *Calcif Tissue Res* 5(4):305-316, 1970.

The intracellular localization of calcium in the mucosal lining of the small intestine of normal, rachitic, and vitamin D_2-treated rats was studied using ^{45}Ca-autoradiography, microincineration, and electron microscopy. Small, electron-dense granules and autoradiographic label were seen primarily within microvilli and mitochondria. The granules were sparse in mitochondria from rachitic rats and regularly distributed in normal rat mitochondria. The mitochondria of vitamin D_2-treated rats contained numerous electron dense granules which remained following microincineration. An inverse relation in the amount of granules appearing in the mitochondria and in the microvillus was found. Granules were limited to the microvillus region in the rachitic animals and increased in the mitochondria following treatment with vitamin D_2. Apparently a large amount of calcium is absorbed across the cell membrane and is then bound within the microvillus; vitamin D is probably necessary for mobilizing this bound calcium from the microvilli. Reduction of transcellular transport of calcium in rickets seems to be associated with reduced mitochondrial calcium binding and the inability to accept calcium from the microvilli.

8556 EFFECT OF LYSOLECITHIN, DIGITOXIN AND PHOSPHOLIPASE A UPON THE DOG'S GASTRIC MUCOSAL BARRIER. *(E.)* Davenport, H. W. (Dept. Physiol., U. Michigan, Ann Arbor). *Gastroenterology* 59(4):505-509, 1970.

The effects of lysolecithin, digitonin, and phospholipase A on the gastric mucosa barrier were studied by irrigating separated, vagally denervated pouches of the oxyntic gland area of the dog's stomach first with a test solution of 100 mM HCl and 54 mM NaCl, then with a solution of the agent in 30 mM phosphate buffer, pH 7.4, and again with the acid test solution. Fluxes of Na$^+$ and H$^+$ were measured, and changes over fluxes found in control tests were taken as evidence that the gastric mucosa barrier had been broken. Lysolecithin (20 to 160 mg/100 ml) and digitonin (1.56 to 100 mg/100 ml) broke the barrier; solutions of lyophilized venom of *Naja naja* (50 mg/100 ml) were also effective. Phospholipase A and barrier-breaking activities of *N. naja* venom survived 15 min heating to 100 C at pH 5.5. Lyophilized venom of Russell's viper and human pancreatic juice, both of which had phospholipase A activity, did not break the barrier. The effects of the agents upon the gastric mucosa were similar to their action on erythrocyte membrance.

8557 INVESTIGATIONS ON THE ABSORPTION OF AZULFIDINE. *(E.)* Muller-Wieland, K. (1st Med. Clin. U. Hamburg, Germany), W. Berndt and O. Hirt. *Amer J Proctol* 21(5):337-340, 1970.

The metabolic fate (absorption, metabolism, and excretion) of Azulfidine determined with chromatography, colorimetry, and radioactivity and reported by various authors was reviewed. Azulfidine (p.o.) was excreted largely with the feces but that which was absorbed was degraded into 5-aminosalicylic acid, sulfapyridine, and several other products within 1 hr. Intact Azulfidine and 5-aminosalicylic acid accumulated in connective tissue throughout the body and in peritoneal, pleural, and synovial fluids. Azulfidine also accumulated in the liver and lungs, while sulfapyridine spread diffusely through the organism. Analysis of urine revealed only a small amount of Azulfidine, indicating that it was degraded before its passage through the kidney; since all of the metabolites were not yellow, some escaped colorimetric detection and were investigated using the method of Bratton and Marshall.

8558 INTESTINAL TRANSPORT OF AMINO ACIDS IN A LIZARD DURING HIBERNATION AND ACTIVITY. *(E.)* Qadri, M. U. N. (Dept. Biochem, U. Karachi, West Pakiston), B. K. Zain and M. Zain-Ul-Abedin. *Comp Biochem Physiol* 36(3):569-577, 1970.

The intestinal transport of 8 amino acids (L-leucine, L-lysine, L-glutamamic acid, L-cystine, L-serine, DL-phenylalanine, DL-tryptophan and L-proline) was studied in a hibernating lizard using the everted-sac technique. No difference in the transport in various regions of the intestine was seen. All these amino acids were passively transported during the

tive period and hibernation but the rate of trans-
t was much greater during activity. Active trans-
t of these amino acids also occurred both during
active period and more slowly during hibernation;
tamic acid, however, was not actively transported
ing hibernation.

59 FASTING AND ALLOXAN DIABETES EFFECTS ON INTESTINAL TRANSPORT OF MONOSACCHARIDES.
) Axelrad, A. D. (Dept. Biol., U. Houston, Tex.,),
L. Lawrence and R. L. Hazlewood. *Amer J Physiol*
(4):860-864, 1970.

effects of fasting for 24, 48, and 72 hr and the
ects of alloxan diabetes on the absorption of D-
ucose and 3-O-methylglucopyranoside were studied
rats using an *in vitro* everted intestinal sac
hod. That active transport of monosaccharides
increased by fasting for 24-72 hr was shown by
9% increase in serosal concentration of 3-O-
thylglucopyranoside. Absorption of both mono-
charides was enhanced significantly in both
ort-term (3-8 days) and long-term (90-180 days)
oxan diabetes. The long-term study allows for
istinction to be made of a diabetic effect from
ossible toxic effect of alloxan.

60 VITAMIN D, TISSUE CALCIUM, AND CALCIUM TRANSPORT IN THE *IN VIVO* RAT SMALL INTES-
NE. *(E.)* Urban, E. (Dept. Intern. Med., U. Iowa,
a City) and H. P. Schedl. *Amer J Physiol* 219(4):
-951, 1970.

effect of vitamin D on intestinal tissue con-
t of ^{40}Ca and ^{45}Ca was studied with *in situ* pre-
rations of duodenal and ileal intestinal segments
m deficient and vitamin-repleted rats perfused
rough the lumen with an isotonic solution of 3.4
calcium with isotopic ^{45}Ca as tracer. Vitamin
pletion increased *in vivo* transport and concurrently
creased tissue ^{45}Ca concentration and specific ac-
vity of the mucosal fraction, and there was no vita-
n D effect on the underlying tissues. Vitamin D
d no effect on endogenous ^{40}Ca of unperfused tissue,
r was the ^{40}Ca content of perfused tissue in-
uenced. Calculations of mucosal cell fluxes
owed that vitamin D increased entry and exit
uxes at the basal pole of the cell, but had minimal
fect on entry flux at the luminal face of the cell.
major site of action of vitamin D in the mucosal
ll is at the second or release step in the trans-
rt of calcium from lumen to blood.

8573 COMPARISON OF EFFECTS OF GASTRIN, CHOLECYSTOKININ-PANCREOZYMIN, SECRETIN AND GLUCAGON ON HUMAN STOMACH MUSCLE *IN VITRO*. *(E.)* Phillips, S. F. (Mayo Clin., Rochester, Minn.), A. J. Cameron and W. H. J. Summerskill. *Gastroenterology* 59(4):539-545, 1970.

A constant concentration of one of the gastrointestinal hormones (gastrin, secretin, glucagon or cholecystokinin-pancreozymin) was applied to isolated strips of human gastric muscle obtained from fresh surgical specimens. After bathing in a modified Krebs solution at 37°C under a 2 gm tension for a variable period, the strips taken from the antrum exhibited rhythmic contractions at a mean rate of 3.25 per min, and strips from the corpus of the stomach had a rate of 3.41 per min. Addition of gastrin to the bathing solution caused a 2- to 3-fold increase in the spontaneous contractions without any significant decrease in the resting length of the strip. The lowest effective dose of gastrin for antral strips was 0.01 µg/ml and for corpus strips was 0.1 µg/ml. Cholecystokinin-pancreozymin, at a concentration of 0.1 U per ml, caused increased amplitude in contractions of antral and corpus strips, but a dose of 0.01 U per ml had no significant effect. Secretin, at a dose of 1 U per ml, usually caused the amplitude of contractions to decrease by 50-100% in both antral and corpus strips, and often caused strip relaxation, with a mean increase in strip length of 0.19 mm compared with a mean lengthening of control strips of 0.07 mm. Glucagon, in concentrations of up to 1 µg/ml, had no effect on contraction length or amplitude of gastric antral or corpus strips. None of the hormones tested altered the contraction frequency of antral or corpus strips.

8580 EFFECT OF SECRETIN ON GASTRIC ACID SECRETION IN RESPONSE TO CHOLINERGIC STIMULI. *(E.)* Way, L. W. (Dept. Surg., U. California, San Francisco). *Gastroenterology* 59(4):510-517, 1970.

The effect of secretin on gastric acid secretion after cholinergic stimulation was studied in dogs prepared with antrectomies, gastric fistulas, and Pavlov pouches. A threshold dose of histamine was given by continuous i.v. infusion and insulin, 0.5 or 0.25 U/kg, or 2-deoxyglucose, 0.15 g/kg, was injected after acid secretion had reached a plateau, causing secretory responses similar to those stimulated by insulin or 2-deoxyglucose in animals with intact antrums. Secretin 2 U/kg/hr did not alter acid output in response to insulin or 2-deoxyglucose, but enhanced pepsin secretion after 2-deoxyglucose; secretin did not change an already high pepsin response to insulin. Acid and pepsin secretion stimulated by a continuous i.v. infusion of bethanechol (0.15 mg/kg/hr) was compared with secretory rates when secretin was added to the infusion: secretin depressed acid and increased pepsin output due to bethanechol. In dogs with gastric fistulas, Pavlov pouches, and intact antrums, secretin markedly inhibited acid secretion in response to insulin or 2-deoxyglucose. Direct cholinergic stimulation of parietal cells is apparently not inhibited by secretin, and the inhibition observed in animals with intact antrums was probably due to an antagonism by secretin of vagally released gastrin. Since bethanechol-stimulated acid secretion was inhibited by secretin in antrectomized animals the response to bethanechol may be due to the release of an endogenous humoral gastric stimulant other than antral gastrin as well as a direct effect of bethanechol on parietal cells.

8581 EFFECT OF PROSTAGLANDIN E_1 ON BASAL GASTRIC SECRETION IN MAN. *(Ger.)* Classen, M. (Med. Clin. Polyclin. U. Erlangen-Nuremberg, Germany), H. Koch, P. Deyhle, S. Weidenhiller and L. Cemling. *Klin Wschr* 48(14):876-878, 1970.

The effect of prostaglandin E_1 on gastric secretion was studied in 6 male volunteers, average age 29, who received 300 μg (4-5 μg/kg) of this compound (i.v. in 250 ml solution) 30 min after measurement of basal acid secretion. Inhibition of gastric secretion occurred in 4 subjects within 15 min of start of infusion and reached a maximal inhibition between 16 and 30 min of infusion in 5 subjects. Acid secretion decreased further in 2 subjects and increased in 4 subjects (becoming higher than basal secretion in 3 subjects) following the infusion. Side effects such as headache, muscle pain (proximal to the infusion point) and enhanced pulse beating were tolerable. A moderate fall of blood pressure (below 90 mm Hg, systolic) was noticed in one subject.

8582 IMMUNOCHEMICAL MEASUREMENTS OF ENDOGENOUS GASTRIN RELEASE. *(E.)* McGuigan, J. E. (U. Florida Coll. Med., Gainesville), B. M. Jaffe and W. T. Newton. *Gastroenterology* 59(4):499-504, 1970.

Serum gastrin concentrations in portal, hepatic and peripheral venous sera before and following acetylcholine-provoked release of gastrin from the antral mucosa of dogs were investigated by radioimmunoassay techniques. Polyethylene catheters were inserted in the portal vein, hepatic vein, left femoral vein, and thoracic duct of anesthetized dogs after which the pyloric region of the stomach was irrigated for 10 min with 1% (w/v) acetylcholine solution. Gastrin concentrations were found to increase within 2½ min of initiation of acetylcholine irrigation in the portal vein sera; prompt increases in serum gastrin concentrations were also measured in hepatic and peripheral venous blood. Highest concentrations of gastrin were achieved in portal venous sera; the mean gastrin concentrations in hepatic vein sera were 60% of those in portal sera obtained simultaneously. Increases in peripheral venous gastrin concentrations were observed within 10 min of initiation of acetylcholine irrigation, but thoracic duct lymph gastrin levels were consistently less than peripheral venous serum gastrin levels in response to acetylcholine stimulation. The thoracic duct lymph does not appear to be a major route for conduction of immunoreactive gastrin to the peripheral circulation following acetylcholine stimulation of the stomach.

8583 ASSAY OF TWO PEPSIN FRACTIONS IN HUMAN GASTRIC JUICE BY ALKALI INACTIVATION. *(E.)* Seijffers, M. J. (Hebrew U. Hadassah Hosp., Jerusalem, Israel) and R. Tkatch. *Gastroenterology* 59(4):528-533, 1970.

An alkali inactivation technique for the quantitative determination of the proteolytic activity of alkali-stable and alkali-labile pepsins was described and its results were compared with those obtained by column chromatography assay of the same fractions. Basal and histamine-stimulated samples of gastric juice were collected and subjected to column chromatography for separation of pepsins and proteolytic activity was measured with acid hemoglobin and the alkali-stable pepsin was measured from the residual proteolytic activity after 90 min incubation of the gastric acid sample at 20°C and pH 7.1. The alkali-labile sample was determined from the total proteolytic activity minus the alkali-stable pepsin. The alkali-stable pepsin proteolytic activity obtained by the alkali intervention technique was equivalent to that of Pepsin I (as measured by the column chromatographic fractionations of gastric juice) and the alkali-labile pepsin activity was attributable to the other pepsins present in human gastric juice. Comparison of the ratios of alkali-stable pepsin to alkali-labile pepsin obtained by both alkali—inactivation and chromatography showed no significant difference between the two methods.

8584 PREVENTING EFFECTS OF BENZYL-TRI(β-PROPOXYETHYL)AMMONIUM IODIDE (U-247-51) AND BENZYL-TRI(β-BUTOXYETHYL)AMMONIUM BROMIDE (U-247-73) ON EXPERIMENTAL GASTRIC ULCERS. *(E.)* Matsumoto, T. (Fac. Med., Kyoto U., Japan). *Acta Sch Med Univ Kyoto* 40(3):205-220, 1970.

The effects of benzyl-tri(beta-propoxymethyl)ammonium iodide (U-247-51) and benzyl-tri(beta-butoxyethyl) ammonium bromide (U-247-73) on spontaneous and drug-induced gastric secretion and the formation of experimental gastric ulcers were studied in rats. Both agents depressed gastric secretion volume and acidity, and decreased the incidence of gastric ulcers in Shay rats. Gastric ulcers caused by serotonin and stress stimulation in the rats were also depressed by both agents, but those caused by reserpine were not affected. The gastric ulcers and secretion caused by histamine, eserine, phenylbutazone, caffeine and stress stimulation in Shay rats were also depressed by both test agents. The i.p. administration of both agents decreased the level of catecholamine in the adrenal gland and atria.

8585 THE EFFECT OF ACTH AND CORTISONE ON THE INCORPORATION OF S^{35} (SULFATE) INTO THE MUCOUS CELLS OF THE RAT STOMACH. *(E.)* Kozlowska, K. (Med. Acad. Gdansk, Poland). *Jahrbuch Morph Mikroskop Anat* 82(2):219-228, 1970.

The effect of i.p. injections of cortisone and ACTH on the incorporation of radioactive sulfur (administered as $Na_2S^{35}O_4$) into the neck mucous cells of the gastric fundic glands and the pyloric gland mucous cells was studied in male Wistar rats. One group of rats served as saline-injected controls; a second group received 5 separate injections of 25 mg of cortisone acetate spaced 90 min apart; and the third group of rats received 25 mg of ACTH at the same dosage schedule. Portions of the fundus and pyloric regions of the stomach were excised from all rats under anesthesia, were fixed and stained, and were measured for presence of previously administered radioactive sulfur by autoradiographic methods. Cortisone reduced the incorporation of S^{35} in the mucous fundus gland cell, and increased the incorporation into the mucous cells of the pyloric glands. The average number of silver grains in autoradiographs of mucous cell of fundic glands were 47.09 in control rats and 36.97 in cortisone-treated rats, while these values in mucous cells of the pyloric glands were 33.12 and 58.93, resp. In the ACTH-treated rats, there was a slight increase in the amount of S^{35} incorporated into the mucous cells of the fundic glands (silver grain count=52.36), and a significant increase in the mucous cells of the pyloric glands (silver grain count=50.32).

Pancreas

8597 PANCREATIC RESPONSE TO ACIDIFICATION OF VARIOUS LENGTHS OF PROXIMAL INTESTINE IN THE DOG. *(E.)* Meyer, J. H. (VA Ctr., Los Angeles, Calif.), L. W. Way and M. I. Grossman. *Amer J Physiol* 219(4):971-977, 1970.

A technique was developed that allows quantitative diversion of perfusate from intact small intestine, and pancreatic response to regional acidification of proximal small bowel was studied and compared to the response to acidification of uninterrupted bowel in the same dogs. Pancreatic response to intestinal acidification was in part a function of length of intestine acidified; when acidified with 4 mEq HCl/15 min (0.16 N at 25 ml/15 min) an 11.5 cm segment of the first part of the duodenum gave 10% and a 45-cm segment gave 75% of the bicarbonate response seen when uninterrupted bowel was similarly perfused. With a segment of fixed length, pancreatic response varied as a linear function of titratable acid entering the segment per unit time until a maximal response was obtained. This maximal response from a 45-cm segment was approximately equal to the response to 1 U/kg-hr exogenous secretin by i.v. infusion. The relation of response to amount of titratable acid entering the segment per unit time cannot be explained as a simple function of intraluminal pH; it may be related to pH at a mucosal site where receptors for release of secretin are located.

8598 THE INCORPORATION OF ENZYME-PROTEINS IN THE PANCREAS OF THE ADRENALECTOMIZED RAT TREATED WITH CORTISONE. *(Ger.)* Wanke, M. (Path. Inst. U. Heidelberg, Germany), K. Wegener and H. Lahmann. *Virchow Arch Path Anat* 350(3):275-287, 1970.

The effect of cortisone on pancreatic enzyme formation 10 days after bilateral adrenalectomy was investigated in 70 rats; 20 intact rats served as controls. Adrenalectomy produced atrophy of the pancreas which was macroscopically evident and microscopically was characterized by vacuolization of acinar epithelium and reduction of zymogen granules. Administration of cortisone (2.5 mg/100 g) changed the histological picture dramatically within 4 hr, producing a distinct increase in zymogen granule content. The trypsin content of the pancreas homogenate was drastically reduced after bilateral adrenalectomy (80% less than intact controls), while it increased after subsequent cortisone administration to a value 12% higher than that of the controls. Two hours after cortisone administration, autoradiography demonstrated a 3.5-fold higher number of silver granules over the total cytoplasm than seen in adrenalectomized animals which did not receive cortisone; the increase in the number of silver granules in nuclei after cortisone administration was insignificant. The activities of cytoplasm and nucleus reflected the relative importance for the acceleration of the cortisone-induced enzyme synthesis; a close relationship between adrenal cortex and amino acid uptake of the exocrine cells of the pancreas appears to exist.

8599 PANCREATIC BICARBONATE RESPONSE TO VARIOUS ACIDS IN DUODENUM OF THE DOG. *(E.)* Meyer, J. H. (VA Ctr., Los Angeles, Calif.), L. W. Way and M. I. Grossman. *Amer J Physiol* 219(4):964-970, 1970.

Pancreatic bicarbonate secretion was observed in response to duodenal acidification in dogs with chronic pancreatic fistulas with each of five acids: HCl, H_2SO_4, H_3PO_4, lactic, and citric. Over the range from pH 0 to pH 3, bicarbonate secretion was independent of the pH of acid entering the intestine. Above pH 3 there was a rapid decrease in bicarbonate secretion until at pH 4.5 to pH 5.0 an absolute threshold was detected above which no bicarbonate secretion occurred. At all pH values below this threshold the rate of pancreatic bicarbonate secretion was a function of the rate of entry (mEq/15 min) of titratable acid (end point pH 4.5) independent of the concentration of the acid. Weak (undissociated) acids as well as strong acids showed this relation between titratable acid and response. The amount of bicarbonate secreted per mEq acid introduced was less with weak acids (higher pK) than with strong. The rate of secretin release appears to be a function of the length of intestine acidified below a critical pH.

SECRETION AND METABOLISM

Hepatobiliary Tract

8606 ACCUMULATION AND RELEASE OF TRIGLYCERIDES BY RAT LIVER FOLLOWING PARTIAL HEPATECTOMY. *(E.)* Delahunty, T. J. (Dept. Biochem., McGill U., Montreal, Quebec, Canada) and D. Rubinstein. *J Lipid Res* 11(6):536-543, 1970.

Lipid accumulation and secretion by livers of partially hepatectomized rats were studied *in vivo* and in the perfused liver. Regenerating liver accumulated lipid for about 20 hr following partial hepatectomy, and during this time incorporation of i.v. palmitate-9,10-^{3}H into β-lipoprotein increased. No change in the level of serum β-lipoproteins was seen 13 hr after partial hepatectomy but the specific activities of the triglycerides in the liver and β-lipoproteins were significantly diminished. Extension of these studies to the isolated perfused liver system demonstrated that 13 hr after partial hepatectomy the regenerating liver was capable of secreting greater quantities of the lipid, but not the protein, moiety of the β-lipoproteins in comparison with liver taken immediately from a partially hepatectomized animal, although there was no difference between the weights of the livers. However, following addition of palmitate-^{3}H and ^{14}C-labeled amino acids to the perfusate, the specific activity of the hepatic and β-lipoprotein triglycerides of the liver excised 13 hr after partial hepatectomy was diminished, but that of the protein was not affected. Prelabeling of the accumulated triglyceride with palmitate-1-^{14}C *in vivo* revealed that the proportions of the accumulated triglyceride secreted as β-lipoproteins by perfused livers excised immediately and 13 hr after partial hepatectomy were identical. The regenerating liver seems to acquire rapidly the ability to mobilize triglycerides at a rate equal to that of the much larger normal liver, so that it can handle all free fatty acids presented to it.

8607 HEPATOBILIARY REGULATION OF LIPID METABOLISM. *(Ger.)* Vecchi, G. P. (Med. Clin. U. Modena, Italy), G. F. Salvioli, R. Salati and W. Spogler. *Schweiz Med Wschr* 100(40):1694-1698, 1970.

The role of liver in the control of physicochemical characteristics of the bile was studied in 5 patients with cholelithiasis, 5 patients with Laennec's cirrhosis and 5 normal subjects. The average cholesterol level was 207 mg %, triglyceride content was 27 mg % and free fatty acids were 1.6 mEq/l in normal bile. Cirrhotic patients had decreased bile cholesterol (114 mg %) and triglyceride (10 mg %) levels while the patients with cholelithiasis had high bile cholesterol (570 mg %) and free fatty acid (3.7 mEq/l levels with no changes in bile phospholipid levels. Such increases in cholesterol content with no variations in phospholipid levels apparently create conditions leading to cholesterol precipitation and gallstone formation. Increased bile free fatty acid levels are indicative of a functional alteration of the liver in terms of esterification processe whereas bile fluidity seems to be specifically affected in cholelithiasis and constitutes a feature of total liver insufficiency in cirrhosis.

8608 THE REDOX STATE OF NAD+/NADH SYSTEMS IN GUINEA PIG LIVER DURING INCREASED FATTY ACID OXIDATION. *(E.)* Willms, B. (Med. U. Clin. Gottingen, Germany), J. Kleineke and H. D. Soling. *Biochim Biophys Acta* 215(3):438-448, 1970.

Changes in the redox state of the substrate pairs lactate/pyruvate, 3-hydroxybutyrate/acetoacetate, glutamate/(α-oxoglutarate)(NH_4+) and α-glycerophos-

nate/dihydroxyacetone phosphate as well as changes
n the ATP/ADP ratio were studied in guinea pig
ivers during increased oxidation of fatty acids
n vivo and during liver perfusion. The redox state
f the lactate/pyruvate system in isolated perfused
uinea pig livers became more negative, whereas the
edox state of the 3-hydroxybutyrate/acetoacetate
ystem showed a slight increase only during prolonged
atty acid oxidation. *In vivo*, fat feeding for 3
ays increased the lactate/pyruvate ratio and the
-glycerophosphate/dihydroxyacetone phosphate ratio,
nd doubled the 3-hydroxybutyrate/acetoacetate ratio.
he ATP/ADP ratio in the guinea pig liver was not
ltered by an increased oxidation of fatty acids.
nder normal conditions the redox state of the 3-
ydroxybutyrate dehydrogenase system and that of
he glutamate dehydrogenase (EC 1.4.3) system were
n equilibrium in rat and guinea pig liver; under
ertain experimental conditions a disequilibrium
as observed in both animals probably due to dif-
erent compartmentation of some of the substrates
f these redox systems. The more negative state
f the cytoplasmic NAD+/NADH system in guinea pig
iver can affect the activity of pyruvate carboxy-
ase by leading to relatively lower concentrations
f pyruvate, but the redox state of the 3-hydroxy-
utyrate dehydrogenase system does not seem to
egulate the activity of pyruvate carboxylase in
uinea pig liver under the given experimental con-
itions.

509 FATTY ACID BIOSYNTHESIS: VII. SUBSTRATE CONTROL OF CHAIN-LENGTH OF PRODUCTS SYN-
HESIZED BY RAT LIVER FATTY ACID SYNTHETASE. *(E.)*
ansen, H. J. M. (Dept. Biochem., U. Nottingham,
ngland), E. M. Carey and R. Dils. *Biochim Biophys*
ta 210(3):400-410, 1970.

he chain-lengths of fatty acids synthesized by puri-
ied rat liver fatty acid synthetase from 1-^{14}C-
cetyl-CoA, 1,3-$^{14}C_2$-malonyl-CoA and from 1-^{14}C-acetyl-
oA plus partially purified rat liver acetyl-CoA
arboxylase were determined by gas-liquid and paper
hromatography. The relative amount of radioactivity
ncorporated from added acetyl-CoA and malonyl-CoA
epended on the substrate concentrations used. With
xcess acetyl-CoA to malonyl-CoA, greater amounts of
cetyl-CoA were incorporated than theoretically ex-
ected from the malonyl-CoA pathway; with excess
alonyl-CoA, less acetyl-CoA was incorporated than
heoretically expected. An increase in the chain-
ength of fatty acids synthesised from malonyl-CoA
as observed with increasing malonyl-CoA concentra-
ions and malonyl-CoA to acetyl-CoA ratios; a simi-
ar increase was observed when increasing amounts
f a malonyl-CoA generating system were added. How-
ver, at the same overall rate of synthesis, a
ower proportion of long-chain fatty acids was syn-
hesised from carboxylated acetyl-CoA than from
dded malonyl-CoA. Acetyl-CoA carboxylase may car-
oxylate acetate bound to fatty acid synthetase.

510 EFFECTS OF CHOLESTEROL ON BILE ACID METABOLISM IN THE RAT. *(E.)* Beher, W. T.
enry Ford Hosp., Detroit, Mich.), K. K. Casazza, M. E. Beher, A. M. Filus and J. Bertasius. *Proc Soc Exp Biol Med* 134(3):595-602, 1970.

The effects of cholesterol feeding and accumulated tissue cholesterol on bile acid metabolism in normal female rats were studied. Diets supplemented with cholesterol (1%) and corn oil (3%) over the entire experimental period (3 weeks) resulted in decreases in the cholic and chenodeoxycholic acid pool half-lives of 1.6 and 0.9 days, resp. In experiments on rats with accumulated tissue cholesterol fed unsupplemented basal rations during the experimental period, the half-lives of these acids also decreased 1.6 and 0.9 days, resp., from the values for normal control rats. In both the dietary and accumulated tissue cholesterol experiments, the total bile acid pool concentration was unchanged (approximately 6.2 mg/100 g and 10 mg/100 g rat, resp.) but there was an important decrease in cholic acid concentration (from 5.4 to 3.5 mg/100 g rat in both cases, resp.) accompanied by a compensating increase in chenodeoxycholic concentration (from 0.8 to 1.8 and from 1.2 to 2.8 mg/100 g rat, resp.). In the animals with elevated tissue cholesterol the effects on bile acid turnover were not due to increased levels of sterols in the gastrointestinal tract but due to the increased tissue cholesterol levels. Dietary corn oil by itself had no effect on either turnover rates or pool sizes of the bile acids.

8611 PEROXIDATION OF MITOCHONDRIAL LIPIDS AND THE STATE OF MITOCHONDRIAL PROTEINS: EFFECT OF SEVERAL FACTORS. *(Ger.)* Dioguardi, N. (Dept. Path., U. Milan, Italy), G. Ideo, M. Podda and E. Del Ninno. *Schweiz Med Wschr* 100(40):1698-1700, 1970.

Enzyme release from isolated rat liver mitochondria due to alterations in unsaturated fatty acid peroxidation processes (at the mitochondrial membrane level) was studied in terms of metal ion effects in the presence and absence of ascorbic acid and of the effect of corticosteroids and adrenalectomy. Membrane alterations were followed by measuring the increase of enzyme activity in supernates while peroxidation processes were followed by measurement of malonylaldehyde formation. Of the metal ions (calcium, magnesium, manganese and iron (chlorides)) examined, iron was the only ion catalyzing peroxidation of unsaturated fatty acids in the absence of ascorbic acid. Ascorbic acid dependent peroxidation was enhanced by both iron and magnesium ions while calcium and manganese inhibited this process. Maximal mitochondrial enzyme release occurred in the presence of iron, and glutamate dehydrogenase, malate dehydrogenase and glutamic oxaloacetic transaminase activities were highly correlated with the degree of lipid peroxidation; maximal inhibition of enzyme release occurred in presence of manganese. Cortisone produced no changes in either peroxidation or enzyme release, while a high initial velocity in mitochondrial lipid peroxidation occurred in adrenalectomized rats.

8612 INFLUENCE OF METHYLCHOLANTHRENE AND PHENOBARBITAL TREATMENT ON LIVER CHROMATIN TEMPLATE ACTIVITY. *(E.)* Piper, W. N. (Sch. Pharm., Purdue U., Lafayette, Ind.), D. E. Blake and W. F. Bousquet. *Res Commun Chem Path Pharmacol* 1(5):591-606, 1970.

Hepatic chromatin template activity for RNA synthesis was increased by pretreatment of male rats with phenobarbital (100 mg/kg) or 3-methylcholanthrene (30 mg/kg). Treatment of chromatin with acid to remove basic protein abolished these differences in template activity. Adrenalectomy abolished the increase in chromatin template activity produced by phenobarbital treatment, but had no effect on that produced by 3-methylcholanthrene, providing further evidence for a difference in mechanism by which these agents ultimately act to stimulate protein synthesis. The ratio of 3-methylcholanthrene bound to chromatin versus that bound to homogenate protein was 8-9 times larger than that for phenobarbital. An additive effect on chromatin template activity was not observed after pretreatment of rats with both compounds. Neither phenobarbital nor 3-methylcholanthrene pretreatment caused an alteration in turnover of chromatin-histone protein as evidenced by arginine or lysine incorporation or in the acetylation of chromatin protein at 1 or 6 hr after administration, indicating that differences of template activity were not due to altered turnover or acetylation of chromatin protein.

8613 STUDIES ON THE METABOLISM OF C_{19} STEROIDS IN RAT LIVER: VI. HYDROXYLATION OF 4-ANDROSTENE-3,17-DIONE IN RAT LIVER MICROSOMES. *(E.)* Gustafsson, J. A. (Karolinska Inst., Stockholm, Sweden) and B. P. Lisboa. *Acta Endocr* 65(1):84-94, 1970.

Hydroxylation of 4-androstene-3,17-dione by liver microsomes of male rats was investigated, and 6β-, 6α-, 7α-, 16α-, and 18-hydroxyandrostenedione were isolated from the microsomal reaction mixture by thin-layer chromatography and identified by gas chromatography-mass spectrometry. After incubations with testosterone the only 3,17-dioxo-Δ^4-steroids formed were 6β- and 7α-hydroxyandrostenedione. 6α- and 18-Hydroxyandrostenedione were isolated after incubations with 6β- and 18-hydroxytestosterone, resp., indicating that the 17β-hydroxy pathway is probably more important in the formation of 3,7-dioxo-Δ^4-$C_{19}O_3$ steroids.

8614 AMINOPHENAZONE AND CODEINE DEMETHYLATION IN HUMAN LIVER. A STUDY ON MICROSOMAL ELECTRON TRANSFER. *(Ger.)* Ackermann, E. (Med. Acad. Carl Gustav Carus, Dresden, Germany). *Biochem Pharmacol* 19(6):1955-1973, 1970.

The activity of mixed function oxidases and microsomal electron transfer were studied using codeine and aminophenazone on samples of human liver obtained from cholecystectomized patients and compared with corresponding rat liver fractions. The V_{max} of glucose-6-phosphate/6-phosphogluconic acid dehydrogenase in the soluble fraction was 50% of the value in the corresponding rat liver fraction. The V_{max} of both NADPH-cytochrome c reductase and NADH-cytochrome c reductase were lower in man than in rat liver. Molar concentrations of cytochrome b_5 and P-450 in man were only 50% of that found in rat liver, while their spectra were identical to that of rat liver. Microsomal Fe_x (oxidized NADPH-acceptor) revealed spectral features of a low spin hemoprotein. The V_{max} for aminophenazone and codeine were lower in the human microsomal fraction while the K_m's were 10 and 40 times higher, resp. than in rat microsomes.

8615 INDUCTION OF THE HEPATIC SYNTHESIS OF β-LIPOPROTEINS BY HIGH CONCENTRATIONS OF FATTY ACIDS: EFFECT OF ACTINOMYCIN D. *(E.)* Alcindor, L. G. (C.H.U. St. Antoine, Paris, France), R. Infante, C. Soler-Argilaga, A. Raisonnier, J. Polonovski and J. Caroli. *Biochim Biophys Acta* 210(3):483-486, 1970.

The effect of actinomycin D on the induction of hepatic lipoprotein synthesis was measured in livers from male Wistar rats, perfused with blood containing high concentrations of albumin-complexed fatty acids. The rats received a 20% glucose solution during the 18 hr preceding the perfusion, in order to raise liver glycogen reserves. The perfusion medium was 60 ml fresh buffered rat blood containing 4 gm/100 ml of albumin and actinomycin D was added to the perfusate at zero time; labeled leucine was added at 60 min after start of perfusion and oleic acid was added as an albumin-fatty acid complex at 60 min. Radioactivity time was 60 min, and was measured as the amount incorporated in 100 ml of perfusate calculated for 1 gm of wet liver. The radioactivity incorporated into the lipoprotein d < 1.063 was identical in the actinomycin and control groups. Pretreatment of the liver with actinomycin prevented the stimulating effect of fatty acid overload on the release of newly synthesized lipoprotein d < 1.063 into the medium. The amino acid pool and the total radioactive leucine uptake by the liver were unchanged by the fatty acid overload, either with or without actinomycin D.

8616 THE EFFECT OF PERFUSATE pH ON GLUTAMINE METABOLISM IN THE ISOLATED PERFUSED RAT LIVER. *(E.)* Lueck, J. D. (Sch. Med. Dent., U. Rochester, N.Y.) and L. L. Miller. *J Biol Chem* 245(20):5491-5497, 1970.

The effect of perfusate pH on the metabolism of ^{14}C-labeled glutamine was measured in isolated normal rat livers which were perfused with whole heparinized rat blood for 6 hr. The perfusate was maintained at either the normal physiological pH of 7.45 ± 0.05 or at a pH of 7.15 ± 0.05 (a value simulating severe metabolic acidosis) and glutamine utilization was studied by measuring the steady state utilization of ^{14}C-labeled glutamine infused at a constant rate, and the utilization of a single dose of labeled glutamine with concomitant inhibition of glutamine synthesis by methionine sulfoximine. Livers perfused at pH 7.15 utilized one-half as much glutamine from a constant infusion than those per-used at pH 7.45; concentrations of all measured etabolites such as lactate, pyruvate, glutamate, nd α-ketoglutarate were lower at pH 7.15 than at he control pH 7.45. When glutamine synthetase was nhibited by methionine sulfoximine, utilization of single dose of labeled glutamine revealed a half-ife for glutamine of 3.7 hr at pH 7.15 and 1.2 hr t pH 7.45. The perfusate glutamine concentration fter 6 hr of perfusion increased to 90 μg L-glutamine/ l of perfusate at pH 7.15 compared with a constant owered level of -40 μg at pH 7.45. In contrast to -glutamine the uptake of L-glutamic acid by the isoated perfused liver occurred at equal rates at pH .15 and pH 7.45, and there was no significant diference in the percentage of doses oxidized to labeled O_2 or in urea synthesis.

617 GLYOXYLATE METABOLISM BY ISOLATED RAT LIVER PEROXISOMES. *(E.)* Vandor, S. L. Mead Johnson Res. Ctr., Evansville, Ind.) and N. . Tolbert. *Biochim Biophys Acta* 215(5):449-455, 970.

ADH-glyoxylate reductase in isolated rat liver eroxisomes preferentially catalyzed the reduction f glyoxylate to glycolate; it also reduced hydroxyyruvate and pyruvate, but no dehydrogenase activity was measurable at pH 9.2. Michaelis constants were 1.5 mM for glyoxylate and 10.5 μM for NADH, and he pH optimum was 6.4. A glutamate-glyoxylate minotransferase (EC 2.6.1.4) was also present in at liver peroxisomes which together with NADH-lyoxylate reductase (EC 1.1.1.26) may function in substrate-mediated electron shuttle for the oxidaion of cellular NADH.

618 EFFECT OF ESSENTIAL FATTY ACID DEFICIENCY ON RELEASE OF TRIGLYCERIDES Y THE PERFUSED RAT LIVER. *(E.)* Fukazawa, T. Hormel Inst., U. Minnesota, Austin), O. S. Privett nd Y. Takahashi. *J Lipid Res* 11(6):522-527, 1970.

riglyceride release was studied in perfused livers f rats fed fat-free diets or diets containing hyrogenated coconut oil or corn oil. Infusion with odium oleate or linoleate caused an accumulation f triglycerides in the livers of corn oil-fed nimals and stimulated the release of triglycerides nto the perfusing medium. In similar experiments ith essential fatty acid-deficient animals, which ere fed fat-free diets or diets containing hyrogenated coconut oil, there was no increase in ecretion of triglycerides into the perfusate, and he amount of triglyceride which accumulated in the iver was greater than in the livers of the control corn oil-fed) animals. Tracer experiments with leate-1-^{14}C or linoleate-1-^{14}C also showed that ith livers of essential fatty acid-deficient anials, secretion of triglyceride into the perfusate as not stimulated by infusion of fatty acids into he perfusing medium. Impairment of the secretion f triglycerides appears to be a factor in the acculation of fat in the livers of essential fatty cid-deficient animals.

8619 CHOLERETIC EFFECTS OF CHOLECYSTOKININ, GASTRIN II, AND CERULEIN IN THE DOG. *(E.)* Jones, R. S. (VA Ctr., Los Angeles, Calif.) and M. I. Grossman. *Amer J Physiol* 219(4):1014-1018, 1970.

The choleretic effects of cholecytokinin, gastrin II and cerulein were studied in mongrel dogs prepared by cholecystectomy, ligation of the lesser pancreatic duct, insertion of gastric and duodenal cannulas and cannulation of the common bile duct through the duodenal cannula. The flow and composition of hepatic bile were observed during i.v. infusion of a constant dose rate of sodium taurocholate (5 mg/ml/min) with and without various doses of cholecystokinin, cerulein, and gastrin II. Each of the peptides produced increased bile flow (1.6-2.3-fold) and bicarbonate concentration (2-3-fold). Cholecystokinin and cerulein produced increased bile chloride concentration by 10%; the slopes and positions of the lines relating bile flow rate to bicarbonate and chloride concentration during stimulation by cholecystokinin and cerulein were not different. Dose-response lines for cerulein and cholecystokinin were evaluated using Michaelis-Menten kinetic constants; the relative choleretic potency in decreasing order was cerulein, cholecystokinin, gastrin II.

8620 ACCELERATED RESPONSE OF HEPATIC DNA SYNTHESIS TO PARTIAL HEPATECTOMY IN RATS PRETREATED WITH GROWTH HORMONE OR SURGICAL STRESS. *(E.)* Moolten, F. L. (Boston U. Sch. Med., Mass.), N. J. Oakman and N. L. R. Bucher. *Cancer Res* 30(9):2353-2357, 1970.

The effects of surgical stress (laparotomy, sham adrenalectomy, and adrenalectomy), cortisone, hydrocortisone, ACTH, and growth hormone on the response of hepatic DNA synthesis to partial hepatectomy (68%) were determined in young rats (28-32 days old) by measuring the specific activity (dpm/mg DNA) of the DNA, 1 hr after thymidine-^{14}C injection (0.4 μC, i.v.). Laparotomy (3084) performed 4.5 to 8 hr before hepatectomy, and sham adrenalectomy (8225) and adrenalectomy (4567) performed 3 days before hepatectomy enhanced the control response of hepatic DNA synthesis (826), while sham adrenalectomy (2083) and adrenalectomy (2600) had no effect on the DNA synthesis when hepatectomy was not performed (2607). Cortisone (5 mg, i.p.), hydrocortisone (1-8 mg, s.c. or 1-25 mg, i.p.), and ACTH (0.75-1.50 units, s.c.) administered 4-8 hr before hepatectomy had no effect on hepatic DNA synthesis, but bovine growth hormone (s.c.) increased DNA synthesis above the sodium chloride-pretreated hepatectomized control values (3912) proportionally to the dose (4716 at 0.03 mg to 13732 at .15 mg). The specific activity of DNA was determined 14 hr after hepatectomy in all the above studies, but to test the possibility that growth hormones might effect an earlier onset of DNA synthesis rather than an increased production, the specific activity of DNA was determined 10 hr after hepatectomy and the rats pretreated with growth hormone already exhibited higher DNA specific activity (3041) than the controls (2147). The peak of DNA synthesis which normally occurs 20 hr after hepatectomy was not significantly increased by the growth hormone pretreatment (20938 compared to 16882) further supporting the theory of earlier onset of DNA synthesis.

8621 THE EFFECT OF 5-FLUOROURACIL ON ULTRASTRUCTURE AND RNA LABELING IN THE LIVER OF RATS FOLLOWING PARTIAL HEPATECTOMY. *(E.)* Stenram, U. (Dept. Path., U. Uppsala, Sweden) and R. Willen. *Chem Biol Interaction* 2(2):79-88, 1970.

The effect of 5-fluorouracil on regeneration processes in the liver was studied in hepatectomized rats by measuring ^{3}H-cytidine incorporation into RNA. Administration of 5-fluorouracil (0.1 mg i.p. once before and twice following hepatectomy) permitted the usual enlargement of liver-cell nucleoli after partial hepatectomy, but prevented the appearance of ribosomes in the cytoplasm which became rich in smooth-surfaced endoplasmic reticulum. 5-Fluorouracil heavily depressed the labeling of 29 and 18 S RNA in both hepatectomized and sham-operated animals. The synthesis of pre-ribosomal RNA in the nucleus seems to proceed in the presence of 5-fluorouracil but its further processing is apparently impaired.

8622 THE EFFECT OF HEPATECTOMY AND SEX HORMONES ON THE PSEUDOCHOLINESTERASE ACTIVITY IN LIVER AND SERUM OF THE RAT. *(E.)* Leeuwin, R. S. (Pharmacol. Lab., U. Amsterdam, Netherlands) and E. T. Groenewoud. *Acta Endocr* 65(1):184-192, 1970.

The combined effects of hepatectomy, castration and treatment with sex hormones on the pseudocholinesterase activity in liver and serum of male and female rats was investigated. Hepatectomy in normal rats resulted in a sharp decline of the pseudocholinesterase activity, subsequently followed in females by a rapid increase to normal values and in males by a very slow increase. Hepatectomy in castrated rats also caused a marked decrease of the pseudocholinesterase activity, but the pseudocholinesterase activity remained at a relatively low level in both castrated females and castrated males. Daily treatment of castrated-hepatectomized females with estradiol benzoate, either immediately or 9 days after hepatectomy induced a gradual restoration of the enzyme activity to and above the normal castrate level. When castrated-hepatectomized males were treated daily with testosterone propionate the extremely low activity may even be depressed further. Steroids appear to affect the restoration of the synthetic capacity for pseudocholinesterase; the changes in liver pseudocholinesterase activity were reflected in the serum activity.

8623 INHIBITION OF HEPATIC MICROSOMAL MIXED FUNCTION OXIDASES BY D_2O. *(E.)* Holtzman, J. L. (Natl. Cancer Inst., Baltimore, Md.) and M. L. Carr. *Life Sci* 9(18):1033-1038, 1970.

The effect of D_2O on rat liver microsomal reactions was studied with aniline, 3,4-benzpyrene and ethylmorphine as substrates. Aniline hydroxylase, 3,4-benzpyrene hydroxylase, and ethylmorphine N-demethylase were inhibited 22-30% by 99% D_2O. Endogenous NADPH oxidase was not inhibited nor was the unstimulated NADPH-cytochrome P-450 reductase. On the other hand, both the NADPH oxidase and NADPH-cytochrome P-450 reductase stimulation seen on the addition of ethylmorphine were inhibited 31 and 26%, resp. NADPH cytochrome c reductase activity was inhibited only 13%. The participation of water in mixed function oxidases either through hydration of the proteins or heme, or through a cryptic protonolysis is suggested by these results.

8624 THE POST-MORTEM DIMINUTION OF RAT LIVER MICROSOMAL PROTEIN SYNTHESIZING AND DRUG METABOLIZING ACTIVITIES. *(E.)* Jondorf, W. R. (George Washington U. Sch. Med., Washington, D. C.) and J. D. Donahue. *Res Commun Chem Path Pharmacol* 1(5):581-590, 1970.

The decline of endogenous mRNA-directed and poly U-dependent microsomal L-(^{14}C)-phenylalanine incorporating activities and microsomal drug metabolizing activities by samples obtained under standard conditions from livers excised from donor rats at various times (0-16 hr) after death were measured. The protein synthesizing activities declined rapidly within 6 hr but the drug metabolizing capacity was comparatively stable. The decline of the enzyme activities were arrested either by storing the rat carcasses in the cold (0-4°C) or by excising livers from freshly killed animals and storing these excised organs at 0-4°C before preparing the appropriate subcellular fractions for incubations *in vitro*. No measurable difference in the weights of livers excised as late as 6 hr after the death of the donor animals was seen. At 16 or 20 hr postmortem, however, there was an increase in liver weight of about 35% and a decline in the yield of microsomal fraction per unit weight of liver (50%).

8625 COMPARATIVE STUDIES ON LIVER AND KIDNEY XANTHINE DEHYDROGENASE IN TWO BREEDS OF DOMESTIC CHICKS (*GALLUS DOMESTICUS*) DURING PROLONGED STARVATION. *(E.)* Scholz, R. W. (Dept. Vetr. Sci., Pennsylvania St. U., University Park). *Comp Biochem Physiol* 36(3):503-512, 1970.

Fasting for 8-10 days caused a net loss of soluble liver and kidney protein in both White Leghorn (layer-type) cockerels and Indian River (broiler-type) cockerel, but breed differences were observed in the response of chick liver xanthine dehydrogenase to progressive starvation. Total liver xanthine dehydrogenase activity was not changed significantly during an 8-day fast in White Leghorn cockerels, in contrast to the significant reduction in liver enzyme activity observed after 3 days of fasting in Indian River cockerels (from 3 to 2 units/g body weight). Kidney xanthine dehydrogenase activity during fasting was not changed appreciably in either breed of chick. A relatively small increase in plasma uric acid levels in broiler-type chicks was seen during starvation probably due to hemoconcentration, but could not explain completely the 3-fold increase after 8 days of fasting in layer-type chicks.

8626 SOME STRUCTURAL AND FUNCTIONAL CONSEQUENCES OF HEPATIC ADENOSINE TRIPHOSPHATE DEFICIENCY INDUCED BY INTRAPERITONEAL D-FRUCTOSE ADMINISTRATION. *(E.)* Goldblatt, P. J. (U. Pittsburgh Sch. Med., Pa.), H. Witschi, M. A. Friedman, R. J. Sullivan and K. H. Shull. *Lab Invest* 23(4):378-385, 1970.

Hepatic ATP deficiency in female rats was induced by intraperitoneal injection of 3 mmoles of D-fructose. The ATP content reached 40 to 50% of control levels in 10 min and remained depressed up to 3 hr. Regeneration of control levels, which occurred within 7 hr, was prevented by hadacidin which blocks *de novo* synthesis of adenine nucleotides. Transient depression of hepatic protein synthesis, but no interference with RNA synthesis, was documented. The only ultrastructural alteration-induced (aside from glycogen accumulation) was formation of dense fibrillogranular plaques in 20% of the nucleoli of both fructose- and glucose-treated animals. From a comparison of these findings to similar decreases in hepatic ATP content induced with small doses of ethionine (25 or 50 mg), it appears that ATP levels are important in the maintenance of structural and functional integrity of hepatic cells; these cells can tolerate a considerable degree of ATP loss (approximately 50%) before severe alterations occur.

8627 THE EFFECT OF FASTING AND SEVERAL HYPERGLYCEMIC AGENTS ON THE FREE AMINO ACIDS OF RAT LIVER. *(E.)* Burns, L. C. (Baylor U. Coll. Med., Houston, Tex.), S. K. Meghal and R. E. Koeppe. *Life Sci* 9(18):1045-1051, 1970.

Free amino acid and glycogen concentrations were measured in the livers of normal male rats which were either starved for 48 hr before sacrifice or were fed a normal diet and treated with either glucagon, D-mannoheptulose or hydrocortisone. Fasting increased the total free amino acid pool to 24.6 ± 3.4 μmoles/g liver, compared with a control value of 20.0 ± 3.3 μmoles/g liver in the fed rats, while treatment with hydrocortisone for 5 days significantly increased the amino acid pool to 30.7 ± 4.3 μmoles/g liver. Mannoheptulose treatment resulted in normal values, and glucagon decreased the total amino acid pool to 15.1 ± 4.0 μmoles/g liver. Significant differences between fed control rats and rats treated with hydrocortisone were obtained for determinations of glycine, lysine, serine, taurine and ammonia. Liver glycogen concentrations were decreased in 48-hr fasted rats to a mean value of 4.2 mg/g compared with a control value of 59 mg/g in fed rats. Treatment with glucagon decreased liver glycogen to 16.7 mg/g and mannoheptulose decreased it to 12.1 mg/g, while hydrocortisone increased it to 93 mg/g. There was no correlation between hepatic amino acid concentration and rate of gluconeogenesis.

8628 STUDY OF THE EFFECT OF EXOGENOUS GLUCOSE ON THE EXCESS FORMATION OF PORPHYRINS AND NADH IN THE LIVER OF RATS INTOXICATED WITH ETHANOL. *(E.)* Gajdos, A. (Lab. Biochem. Res., U. Paris, France) and M. Gajdos-Torok. *Biochim Biophys Acta* 215(3):550-553, 1970.

The excessive biosynthesis of porphyrins and NADH in rat liver following a high dose of exogenous glucose was studied in female Wistar rats intoxicated with ethanol. Two groups of rats were given a 3-fold diluted ethanol solution i.p. twice a day for one week at a dose of 7.5 ml/kg and on the last 2 days, one group of rats received a 12.5 g/kg glucose solution twice a day by gastric tube; a third group of untreated rats served as normal controls. The animals were decapitated and livers were removed and quantitative determinations were made for ATP, NAD, NADH, δ-aminolevulinate, lactate and pyruvate. In the liver, ethanol intoxication produced a significant decrease in the level of ATP and a significant increase in δ-aminolevulinate synthetase activity and these effects were reversed by glucose treatment. Normal control values for ATP (μmoles per 100 g liver) were 164 ± 11 compared with 83 ± 4.2 in rats intoxicated with ethanol, and 170 ± 17.1 in rats intoxicated with ethanol and treated with glucose. Synthetase activity (μmoles aminolevulinate formed per g per hr was 53.7 ± 4.6 in controls, 144 ± 19.2 in ethanol-treated rats, and 88 ± 12 in ethanol-intoxicated, glucose-treated rats. Ethanol intoxication elevated NADH in liver from a control value of 222 ± 11.8 μg/g to 443 ± 6.9; and this was reversed by glucose to a value of 357 ± 12 μg/g. The hepatic levels of lactate and pyruvate were not modified by ethanol intoxication. The excess porphyrin formation was reflected by the elevated activity of δ-aminolevulinate synthetase activity, the rate-limiting enzyme of porphyrin biosynthesis.

8629 LYSOSOMES AND HEPATIC REGRESSION DURING FASTING. *(E.)* Filkins, J. P. (U. Tennessee Med. Units, Memphis). *Amer J Physiol* 219(4):923-927, 1970.

Various tissue parameters were evaluated as indices of liver regression, and free and total activities of the lysosomal hydrolases (acid phosphatase, β-glucuronidase, acid ribonuclease, and cathepsin D) were measured in livers of male rats sacrificed after fasting 24, 48, 96 or 168 hr. During 24 hr of complete food deprivation, liver mass decreased 33%, protein concentration increased 15%, water concentration was unchanged, and cellularity expressed as nuclei per g of wet liver increased 50%. Within 24 hr and throughout the 168 hr of fasting, total activities of the four lysosomal hydrolases generally increased when expressed either as activity per g liver wet weight or g protein. The free activities of acid phosphatase, but not β-glucuronidase, also consistently increased; by 168 hr the free activities of acid phosphatase and ribonuclease were maximal. Throughout the fasting period total hydrolase activities decreased when expressed either as activity/total wet weight of liver or per cell nuclei, and by 168 hr decreases in total cathepsin and ribonuclease activities were marked. These biochemical data tend to substantiate morphological evidence for a possible role of lysosomal hydrolases in the mobilization of hepatic cytoplasm during fasting; however, neither net increase nor complete maintenance of lysosomal hydrolase activity was observed.

8630 DECREASED HYDROXYLATION OF STEROID HORMONES BY LIVER MICROSOMES FROM RATS BEARING WALKER CARCINOSARCOMA 256. *(E.)* Kato, R. (Natl. Inst. Hyg. Sci., Tokyo, Japan) and A. Takahashi. *Cancer Res* 30(9):2346-2352, 1970.

Progesterone and testosterone hydroxylating activities of liver microsomes were markedly decreased in male and female rats bearing Walker carcinosarcoma 256; the decreases in the hydroxylating activities were greater in the male rats than in the female rats. The content of cytochrome P-450 in liver microsomes was decreased in the tumor-bearing male and female rats, and the binding capacity of P-450 with progesterone and testosterone was decreased in the liver microsomes from male rats, but not from female rats. The administration of 17-methyltestosterone to the tumor-bearing male rats did not prevent the decrease in the binding capacity of P-450 or in the hydroxylating activities for progesterone and testosterone. The decrease in the hydroxylating activities for steroid hormones in the male rats appear to correlate with the decrease in the content of P-450 and the binding capacity of P-450 with steroid hormones, while the decrease in the female rats is correlated with the decrease in the content of P-450.

8631 MULTIPLICITY AND SPECIFICITY OF UDP-GLUCURONYL TRANSFERASE: II. INFLUENCE OF PHENOBARBITAL AND CHOLESTASIS ON THE ACTIVITY OF GLUCURONYL TRANSFERASE AND BETAGLUCURONIDASE IN RAT LIVER. *(E.)* Okolicsanyi, L. (Canton Hosp., Lausanne, Switzerland), J. Frei and P. Magnenat. *Enzymol Biol Clin* 11(5):402-411, 1970.

The effect of phenobarbital treatment on liver glucuronyl transferase was determined with different substrates in Wistar and in Gunn rats and in common bile duct ligated Wistar rats. After phenobarbital administration for 3 days (30-80 mg/kg/day), the changes of glucuronyl transferase activity were similar with all substrates used (4-methyl umbelliferone, p-nitrophenol and bilirubin), which would support the hypothesis of the existence of a single enzyme for the conjugation of the different substrates. In this experimental study, liver β-glucuronidase activity was similarly estimated, and the modifications of this activity compared with those of the glucuronyl transferase. A significant increase of glucuronyl transferase activity was accompanied by a significant decrease of β-glucuronidase activity in Wistar (cholestatic or not) and in Gunn rats after phenobarbital treatment; a significant increase of β-glucuronidase activity corresponded to a slight (but not significant) decrease of glucuronyl transferase activity in cholestatic Wistar rats.

8632 EFFECTS OF ESTRADIOL, DIETARY CHOLESTEROL AND L-THYROXINE ON BILIARY BILE ACID COMPOSITION AND SECRETORY RATE, AND IN PLASMA, LIVER AND BILE CHOLESTEROL LEVELS IN RATS. *(E.)* Uchida, K. (Shionogi Res. Lab., Osaka, Japan), Y. Nomura, M. Kadowaki, K. Miyata and T. Miyake. *Endocr Jap* 17(2):107-121, 1970.

Biliary bile acid composition and secretory rate, as well as cholesterol concentrations in plasma, liver and bile, were investigated in rats given estradiol for 3 days and for 3 weeks, a 2% cholesterol supplemented diet for 4 to 8 weeks, and L-thyroxine for a week, in order to ascertain the relations between cholesterol concentrations in tissues and bile acid production. Biliary samples collected from control rats during the first 2 hr period of cannulation contained 11 mg bile acid/ml of biliary samples on an average, consisting of 69% cholic acid, 7% hyodeoxycholic acid, 6% deoxycholic acid, 6% α-muricholic acid, 5% chenodeoxycholic acid, 3% unidentified acid and minor percentages of other acids. A 3-day treatment with estradiol caused a decrease in plasma cholesterol and an increase in liver cholesterol, but a 3-week treatment with this steroid significant increased the plasma cholesterol level. Either acute or chronic estradiol treatment caused an increase in chenodeoxycholic acid and its derivatives in the bile. When rats were fed the cholesterol diet for several weeks, increases in chenodeoxycholi hyodeoxycholic, α-muricholic and lithocholic acids with a concomitant decrease in cholic acid were observed, accompanied by a slight increase of cholesterol in the liver (30%) and plasma (10%). Both liver and plasma cholesterol levels were markedly elevated by giving cholesterol and sodium cholate simultaneously. L-Thyroxine treatment caused no change in plasma cholesterol level but increased chenodeoxycholic acid formation to provide a biliary bile acid composition similar to that of the rats treated with estradiol or cholesterol diet. Estradiol, cholester or L-thyroxine treatment appears to increase chenodeoxycholic acid formation which seems to be related to an increase in liver cholesterol levels but not to the change in plasma cholesterol level.

8633 EFFECTS OF ETHANOL ON FREE COENZYME A, FREE CARNITINE AND THEIR FATTY ACID ESTERS IN RAT LIVER. *(E.)* Bode, C. (Dept. Med., Marburg, Germany), E. Stahler, H. Kono and H. Goebell. *Biochim Biophys Acta* 210(3):448-453, 1970.

In order to elucidate the mechanism of alcohol-induced hepatic fatty acid accumulation, the effect ethanol on CoA, carnitine and their fatty acid esters in the liver was investigated. A single dose of ethanol (5 g/kg) increased CoA concentration (from 171 to 268 nmoles/g liver) in rats kept on a standard diet. Two hr following the administration of ethanol, the ratio of long chain acyl-CoA free CoA remained nearly unchanged (0.5) as compared to control animals. After 12 hr, when liver triglycerides were markedly elevated, this ratio shifted distinctly in favor of the long chain acyl-CoA (from 0.7 to 1.2, resp.). In protein-deficient rats the long chain acyl-CoA content in the liver increased markedly as compared to controls given a standard diet (from 197 to 334 nmoles/g liver), while the level of free CoA dropped (from 85 to 29 nmoles/g liver, resp.). Under these conditions,

ute ethanol application resulted in extremely
gh long chain acyl-CoA levels, with the ratio of
ng chain acyl-CoA/free CoA increasing from 2.1 to
.4. After ethanol administration, carnitine con-
ntration altered in a similar way to CoA concen-
ation (from 173 to 334 nmoles/g liver, resp.).
wever, the increase of long chain acyl-carnitine
s much less pronounced than the increase of acyl-
A, and the ratio of long chain acyl-carnitine/free
rnitine showed minor alterations during ethanol
idation. Apparently, under conditions in which
anol-induced lipid accumulation in the liver was
served, fatty acid synthesis was reduced by a nega-
ve feedback inhibition of the acetyl-CoA carboxy-
se reaction by high levels of long chain acyl-CoA.
infiltration in the liver after acute ethanol
inistration seems to be caused by enhanced mo-
lization of free fatty acids from adipose tissue
not by stimulation of fatty acid synthesis in
liver.

34 BIOCHEMICAL STUDIES ON THE INFLUENCE ON
DIFFERENT CHOLERETICS UPON SOME UNSPECIFIC
YMES AND UPON ENZYMES OF THE AMINO ACID METABOLISM
RAT LIVER. *(Ger.)* Moritz, K. U. (Inst. Pharma-
. Toxic, Ernst Moritz Arndt U., Greifswald,
many) and A. Grisk. *Acta Biol Med German* 24(5):
-394, 1970.

effect of dehydrocholic acid, p-hydroxyphenylsa-
ylamide, L-phenylpropanol and hydroxyethyl nor-
ene acid succinate on hepatic enzymes was inves-
ated. These choleretics (100 mg/kg dissolved in
pylene glycol) were administered intraduodenally
anesthetized rats and the levels of the following
ymes were determined in liver and, partly, in
um, 30 min and 2 hr after a single administration,
er one administration/day for 14 days: glutamate
uvate transaminase, glutamate oxalate transaminase,
osine α-ketoglutarate transaminase, L-amino acid
dase, glutamate dehydrogenase, histidase, non-
cific alkaline phosphatase, acid phosphatase,
linesterase and lipase. Hepatic glutamate pyru-
transaminase was the only transaminase which
wed marked reduction, from 1218 U to 867 U after
inistration of dehydrocholic acid, and to 750 U
er administration of hydroxyethyl norbornene
succinate; normal values were seen after 2 hr,
after 14 days. Serum levels of glutamate pyru-
transaminase increased 80 to 100 times after
inistration of these two choleretics. Values
hepatic glutamate dehydrogenase were reduced
bout half of those of controls, after adminis-
ion of dehydrocholic acid, p-hydroxyphenyl-
cylamide and hydroxyethyl norbornene acid suc-
ate, while serum levels simultaneously increased
zero to a maximum of 0.483 U. Hepatic histi-
was greatly reduced, to less than 50% of the
, 30 min and 2 hr after administration of L-
ylpropanol and hydroxyethyl norbornene acid
inate. Hepatic acid and alkaline phosphatase
eased 2 to 4-fold after administration of hy-
yethyl norbornene acid succinate, and neither
nalectomy nor pre-treatment with actinomycin
fected these results. All the choleretics ex-
L-phenylpropanol effected a variable reduction
epatic cholinesterase during the entire experimental period and simultaneously increased serum levels.

8635 BIOCHEMICAL MECHANISMS PRODUCING HEPATIC STEATOSIS DUE TO NUCLEOTIDE IMBALANCE. *(Ger.)* Marchetti, M. (Inst. Biochem., U. Bologna, Italy) and G. Moruzzi. *Schweiz Med Wschr* 100(40): 1703-1706, 1970.

Orotic acid, ethionine, 4-aminopyrazolopyrimidine and azaserine were administered to groups of 6 rats, and the mechanisms leading to steatosis of the liver were investigated. Total hepatic lipid increased in all groups 2-2.5 times above control values, due mainly to accumulation of neutral fat (25.1 mg/g liver for control and 78-117 for experimental rats), while cholesterol and phospholipids remained unchanged. Lipogenesis from acetate-^{14}C into total liver lipids decreased significantly in rats fed ethionine, 4-aminopyrazolopyrimidine and azaserine, and increased slightly in rats fed orotic acid. Hepatic protein-bound biotin content was reduced to approximately 64%, 53%, 48% and 78% of the norm with orotic acid, ethionine, 4-aminopyrazolopyrimidine and azaserine, resp; a similar decrease was found in pyridine coenzyme content. A marked reduction of the ATP content from the control value of 1250 to 430 nmole/g liver with orotic acid, 250 nmole/g liver with ethionine, 760 nmole/g liver with azaserine was seen. The increase of ATP to 1907 nmole/g liver with 4-aminopyrazolopyrimidine may have been caused by diminished utilization. Administration of adenine did not affect the total lipid content of controls but restored that of orotic acid- and ethionine-treated rats to the norm, and greatly reduced the values in 4-aminopyrazolopyrimidine- and azaserine-treated rats. Adenine administration slightly increased hepatic lipogenesis and ATP content of controls and restored the corresponding values of experimental animals to normal or nearly normal levels. Electrophoretic investigations showed a clear reduction of serum lipoprotein fractions in experimental rats, indicating that accumulation of hepatic fat was caused by diminished secretion of lipids into the blood, which in turn may be caused by diminished content or by utilization of hepatic ATP-nucleotides.

8636 RIBONUCLEOTIDE REDUCTASE AND CELL PROLIFERATION: I. VARIATIONS OF RIBONUCLEOTIDE REDUCTASE ACTIVITY WITH TUMOR GROWTH RATE IN A SERIES OF RAT HEPATOMAS. *(E.)* Elford, H. L. (Duke U. Med Ctr., Durham, N. C.), M. Freese, E. Passamani and H. P. Morris. *J Biol Chem* 245(20):5228-5233, 1970.

The relation between ribonucleotide reductase and tumor growth rate was measured in a series of rat hepatomas of different growth rates, and an excellent correlation was found between tumor growth rate and the specific activity of ribonucleotide reductase. Differences of 200-fold in enzyme specific activities existed between very fast and slow growing hepatomas. No activity was detected in either normal rat liver or liver from a tumor-bearing animal although 1/500 of the enzyme level in the rapid tumor could have been detected. The thioredoxin-thioredoxin reductase complex which served as the hydrogen donor for this reaction was eliminated as a contributory factor for these differences in activities because this complex was found at comparable levels in both fast growing tumor and normal liver extracts. Two other enzymes involved in deoxyribonucleotide synthesis, thymidylate synthetase and thymidine kinase, were less markedly enhanced with only 15-20-fold and 40-fold differences, resp., between the slow and fast growing tumors. The ribonucleotide reductase reaction seems to be a rate-limiting step in DNA synthesis and cell division, and enzyme synthesis and degradation may be involved in control of this reaction.

8637 PRODUCTION OF HEPATOMAS IN SUCKLING MICE AFTER SINGLE APPLICATION OF β-PROPIOLACTONE.

(E.) Warwick, G. P. (Chester Beatty Res. Inst., London, England) and I. N. Chernozemski. *J Natl Cancer Inst* 45(4):709-717, 1970.

The toxic and carcinogenic effects of β-propiolactone were studied in adult and suckling, male and female mice. Animals given i.p. injections of 10 and 20 mg of β-propiolactone died within 24 hr; mice given 5 mg of β-propiolactone were less active, listless and over 50% of them also died within 24 hr. Animals given 2 mg of β-propiolactone appeared normal and all survived 24 hr after treatment; most survivors died with malignant lymphoma at 6-8 months after injection. Intraperitoneal injection of β-propiolactone (0.1 mg/g body weight) into mice on the 8th-10th day after birth, produced an average of 2 hepatomas per animal in 65% of males 16 months after treatment; in adult mice and controls, hepatoma incidence was 9 and 4-6.7%, resp. β-Propiolactone applied once to skin of suckling mice produced hepatomas in 19.4% of the animals. Treated female mice developed few hepatomas (16-20% bore malignant lymphomas; 5.5% in controls). Microscopic examination showed that hepatomas were trabecular or solid, but without metastases at sites other than the liver.

8638 EFFECT OF ALCOHOL ON THE LIVER OF RATS. III. THE ROLE OF LIPID PEROXIDATION AND SULFHYDRYL COMPOUNDS IN ETHANOL-INDUCED LIVER INJURY.

(E.) Takada, A. (Sch. Med., Kanazawa U., Japan), F. Ikegami, Y. Okumura, Y. Hasumura, R. Kanayama and J. Takeguchi. *Lab Invest* 23(4):421-428, 1970.

The effects of a single administration of ethanol (1.5 g/100 g) to rats on serum ornithine carbamoyl transferase activities, hepatic malondialdehyde production, and reduced glutathione contents were studied to elucidate the role of lipid peroxidation and sulfhydryl compounds on the development of liver injury by alcohol. Serum ornithine carbamoyl transferase activity was elevated only in choline-deficient rats and was accompanied by an increase in hepatic malondialdehyde production and a decrease in hepatic reduced glutathione content after alcohol administration. Elevation of serum ornithine carbamoyl transferase activity was found in the rats showing a high malondialdehyde/reduced glutathione ratio in the liver, with few exceptions. In vitamin E-deficient rats which had very high values of hepatic malondialdehyde production before alcohol administration, an increase in hepatic triglycerides was observed without any accompanying change in hepatic malondialdehyde production and serum ornithine carbamoyl transferase level after alcohol administration. In one of six rats fed a low cystine diet, an elevation of serum ornithine carbamoyl transferase activity after alcohol administration was observed accompanied by a marked reduction in hepatic reduced glutathione content. Increases in hepatic malondialdehyde production after alcohol administration to the choline-deficient rats were inhibited by simultaneous administration of vitamin E, whereas decreases in hepatic reduced glutathione were inhibited by simultaneous administration of reduced glutathione; elevations of serum ornithine carbamoyl transferase activity were inhibited by simultaneous administration of both vitamin E and reduced glutathione. A combination of disturbances in lipid peroxidation and reduced glutathione metabolism in the liver might be responsible for the development of severe liver injury by alcohol.

8639 CHANGES IN THE FINE STRUCTURE OF RAT HEPATOCYTES DURING THE EARLY PHASES OF CHRONIC 2-ACETYLAMINOFLUORENE INTOXICATION.

(E.) Flaks, B. (U. Bristol Med. Sch., England). *Chem Biol Interaction* 2(2):129-150, 1970.

Alterations in the fine structure of rat hepatocytes induced by a diet containing 0.05% of 2-acetylaminofluorene were studied in rats killed after 7-10 days 3-4 weeks and 8-12 weeks of carcinogen treatment. 2-Acetylaminofluorene caused glycogen depletion, proliferation of the agranular endoplasmic reticulum reduction in the quantity and morphological alterations of the granular endoplasmic reticulum, progressive hypertrophy of the Golgi apparatus with an associated increase in lysosomal abundance and, during the later stages of treatment, a reduction in mitochondrial size, but no visible nuclear change Changes affecting the plasma membrane were also observed, including dilatation of the bile canaliculi. Some of the observed changes appeared to be related to those previously observed in preneoplastic liver cells and hepatoma cells of 2-acetylaminofluorene-treated rats and may, therefore, be related to the carcinogenic activity of 2-acetylaminofluorene.

8640 Cd^{++}, Mn^{++} AND Zn^{++} INDUCED SYNTHESIS OF NUCLEAR RNA IN THE LIVERS OF NORMAL AND ADRENALECTOMIZED RATS.

SECRETION AND METABOLISM

Intestine

8685 BIOSYNTHESIS OF LOW DENSITY LIPOPROTEIN BY CELL-FREE PREPARATIONS OF RAT INTESTINAL MUCOSA. *(E.)* Kessler, J. I. (McGill U. Clin., Montreal, Quebec, Canada), J. Stein, D. Dannacker and P. Narcessian. *J Biol Chem* 245(20):5281-5288, 1970.

The capacity of cell-free preparations of rat small intestinal mucosa prelabeled with palmitate-1-^{14}C to synthesize and release lipoproteins was investigated. Whole homogenate, mitochondria, and microsomes were incubated in fortified media containing ^{3}H-labeled amino acids, and lipoproteins of various densities were separated, after the addition of carrier rat plasma, by density centrifugation, by polyanion precipitation, and by immunoprecipitation. All fractions incorporated radioactivity into the lipid and protein moieties of the medium lipoproteins, but the microsomal fraction accounted for most of the activity of the whole homogenate. Presence of postmicrosomal supernatant or pH 5 fraction, GTP, ATP, and ATP-generating system was essential for optimal activity of the microsomal fraction. The identity of microsomal and medium low density lipoprotein with that of plasma medium low density lipoprotein was demonstrated by immunoelectrophoresis, double immunodiffusion, and peptide mapping. The cellular equivalent of the microsomal fraction may be the major site of synthesis and association of the lipid and protein moieties of medium low density lipoproteins; the intestinal mucosa may contribute significantly to the level of plasma medium low density lipoprotein and be of central importance in the transport of exogenous and endogenous lipid.

8686 1-^{14}C-GLUCOSAMINE INCORPORATION BY SUBCELLULAR FRACTIONS OF SMALL INTESTINE MUCOSA: IDENTIFICATION BY PRECURSOR LABELING OF THREE FUNCTIONALLY DISTINCT GLYCOPROTEIN CLASSES. *(E.)* Forstner, G. G. (Inst. Med. Sci., U. Toronto, Ontario, Canada). *J Biol Chem* 245(14):3584-3592, 1970.

Mucin synthesis by the small intestine was studied in rats by following the incorporation of 1-^{14}C-glucosamine into acid-precipitable lipid-free material (glycoprotein) from intestinal mucosal subfractions and from the intestinal lumen. Following injection of 1-^{14}C-glucosamine *in vivo*, specific radioactivity peaks were obtained in the glycoprotein hexosamine of the microsomes at 30 min, the mitochondria at 60 min, the brush border at 90 min, and luminal secretions at 150 min; the most highly labeled hexosamine fractions were found in brush border and luminal glycoproteins after 90 min. Incubation *in vitro* of intestinal slices derived from rats labeled *in vivo* with 1-^{14}C-glucosamine indicated that the highly labeled luminal glycoprotein was derived from mitochondrial and cell sap compartments. A probable precursor of the highly labeled luminal glycoprotein has been identified in the cell sap by column chromatography on Sepharose 4B. The low specific radioactivity of cell sap glycoprotein hexosamine resulted from the presence of a poorly labeled glycoprotein of large molecular weight which has been separated from the highly labeled glycoprotein in the cell sap by Sepharose 4B chromatography. It contained approximately 69% of the hexosamine in cell sap glycoproteins and did not appear in intestinal secretions; this relatively inert glycoprotein may represent structural polysaccharide or storage mucus.

8687 INTESTINAL SECRETION OF IMMUNOGLOBULINS AND ANTIBODIES TO *ESCHERICHIA COLI* IN THE PIG. *(E.)* Porter, P. (Unilever Res. Lab., Bedford, England), D. E. Noakes and W. D. Allen. *Immunology* 18(6):909-920, 1970.

The secretion of specific immunoglobulins (Ig) and antibodies against *E.coli 0141* were studied in intestinal secretions obtained from Thiry Vella loops prepared in the midjejunum of 4 young pigs. The molecular size of specific immunoglobulins were measured by gel filtration and sucrose density gradent ultra-centrifugation, and immune inhibition studies with rabbit antisera specific for IgG, IgA, and IgM were done using hemagglutination techniques. Comparative studies of the intestinal secretions from the four animals (using thin layer Sephadex G200 gel filtration) showed that the intestinal IgM had 7S characteristics and the intestinal IgA had mostly 11S characteristics, similar to secretory IgA isolated in porcine milk. The immune inhibition studies with rabbit anti-IgA-globulin resulted in elimination of *E.coli 0141* antibodies (detected by direct hemagglutination); in one animal incomplete antibody (assayed by antiglobulin hemagglutination) was identified in the fractions associated with IgM and IgG. *E.coli* antibodies in intestinal secretions detected by direct hemagglutination were entirely associated with IgA; however IgM and IgG were also present in significant amounts.

8688 FERRITIN PRODUCTION IN THE RAT SMALL INTESTINE. *(E.)* Bernier, G. M. (Walter Reed Army Inst. Res., Washington, D.C.), S. G. Schade and M. E. Conrad. *Brit J Haemat* 19(3):361-367, 1970.

Several variables affecting *de novo* synthesis of ferritin in the rat intestine were studied using a specific anti-rat ferritin antiserum. Significant ferritin synthesis (measured by ^{14}C-amino acid incorporation) was evoked by a 150 μmole p.o. dose of iron in animals pretreated with similar doses of oral iron 3 and 6 hr before the test dose. Cobalt, a cation absorbed by the intestine in a fashion similar to iron, did not stimulate ferritin synthesis. Parenteral and p.o. iron administration produced different effects on various small intestinal segments. P.o. iron induced synthesis chiefly in the proximal small intestine while i.v. iron stimulated synthesis dominantly in the terminal ileum. Ferritin appears to function chiefly as a barrier to excess iron absorption and as an important mechanism for iron excretion.

8689 QUANTIFICATION OF INTESTINAL FUNCTIONS DURING FASTING: ESTIMATIONS OF BILE SALT TURNOVER, FECAL CALCIUM AND NITROGEN EXCRETIONS. *(E.)* Stanley, M. M. (U. Illinois Coll. Med., Chicago). *Metab Clin Exp* 19(10):865-875, 1970.

Quantification of overall intestinal functions was carried out under fasting conditions by feeding methylcellulose (which resulted in normal daily stool flow) to obese patients. During starvation, turnover and excretion of ^{14}C-cholate and its metabolites, and excretion of stable bile salts fell to very low levels and remained depressed for at least 16 days, the most prolonged interval observed. The prefasting level of excretion was promptly resumed when feeding at the same rate was resumed. During fasting periods single feedings of 25 and 50 g of egg albumin and 25 g corn oil did not increase bile salt excretion and turnover. Consumption of a 1000 calorie mixed diet during one day was followed by a transient increase in excretion. Administration of cholestyramine, 12 g/day, in separate 1-and 3-day courses, produced marked increases in excretion over those during fasting control periods preceding and following. During fasting, bile salts were demonstrated in the duodenal lumen contents. In three persons whose starvation regiments were interrupted by feeding of mixed diets of different calorie content, the excretion rates of bile salts were proportionate to the corresponding quantities of food consumed. The method seems to be a satisfactory one for assaying comparative effects of various single foods and medications upon the turnover of bile salts, and of fecal excretion of other substances such as calcium and nitrogen.

8690 THE EFFECT OF ACTINOMYCIN D ON RAT INTESTINE. *(E.)* Pugh, D. (Zool. Dept. U. Southampton, England). *Ann Histochim* 18(2): 113-118, 1970.

The effect of actinomycin D on rat intestine was investigated. In rats killed 20 hr after administration of antibiotic (0.25 μg/g body weight i.p., single dose) the intestinal epithelium was unchanged compared with that of control animals but there was marked edema of the connective tissues. Autolysis of rat intestinal mucosa, which occurs rapidly after death, was prevented by pretreatment with actinomycin D. Incubation of intestine *in vitro* without essential ions by using sodium chloride solution or by adding EDTA to Ringer solution reduced autolysis while incubation of intestine from treated rats in saline without further antibiotic allowed autolysis to proceed. Actinomycin D may inhibit metal ion utilization and lack of autolysis may be due to changes occurring in cell membranes which prevent water and ion transport into the epithelial cells; it seems unlikely that RNA dependent processes are involved.

GENERAL

8695 *CLOSTRIDIUM PERFRINGENS* AS THE FLORA IN THE INTESTINE OF HEALTHY PERSONS. *(E.)* Akama, K. (Natl. Inst. Hlth., Tokyo, Japan) and S. Otani. *Jap J Med Sci Biol* 23(3):161-175, 1970.

The ecological behavior of *Clostridium perfringens* in the intestine of healthy persons was investigated by using a quantitative method for bacterial count. All the fecal specimens from healthy persons and almost all the contents of the large intestine of corpses contained from 10^1 to 10^9 organisms/g. The heat resistance *C. perfringens* was detected in about half of the fecal specimens heated at 100C for 60 min, and the number were less than 10^6/g of the feces; the resistant organisms seemed to be a permanent inhabitant in some persons. Using the Hobbs' factor sera (Types 1 to 13), the serotypable strains were frequently found among the isolates from the heated specimens, and two or more serological types were often found in single specimens. However, changes in serotypes in a person were observed by repeated examinations. The behavior of *C. perfringens* in the colon and ileum of the corpse were similar to that in fecal specimens from healthy persons, but *C. perfringens* were isolated from the jejunal contents of only 3 out of 12 corpses. All the isolates from jejunum were heat sensitive and three of them were agglutinated by Hobbs' factor sera. The toxinogenicites of the untypable isolates were dependent on the temperature of heating used for isolation, while those of the typable ones varied independently of the temperature.

8696 ON THE VASCULAR ANATOMY OF THE LIVER FOLLOWING PARTIAL HEPATECTOMY IN THE DOG. *(E.)* Aronsen, K. F. (Malmo Gen. Hosp., Sweden), J. G. Norden, G. Nylander, E. G. Ohlsson and B. Pihl. *Acta Chir Scand* 136(5):413-418, 1970.

The vascular anatomy of the liver remnant in 22 dogs subjected to partial hepatectomy was studied by portography and arteriography *in vivo* and macro- and microangiography and the corrosion cast method *ex vivo*. After resection of up to 50% of the liver, rather small changes were seen in the vasculature of the liver remnant during an observation period of 3 months. A constant finding was a stretching and elongation of the vessels throughout the remaining lobes, probably due to outgrowth of the surrounding tissue. The arteriograms of postmortem specimens revealed in lobectomized dogs that the arterial interlobar branches had a straight and regular course while in controls these vessels were tortuous and spiral-formed.

8697 DRUG INDUCED METABOLIC DISORDERS. *(Fr.)* Peters, G. (Inst. Pharmacol., U. Lausanne, Switzerland), F. Roch-Ramel, J. F. Boudry and P. B. Lynedjian. *Ther Umsch* 27(9):594-603, 1970.

DIAGNOSTIC PROCEDURES

8703 THE ANGIOGRAPHIC EVALUATION OF GALLBLADDER DILATATION. *(E.)* Redman, H. C. (Wayne Cty. Gen. Hosp., Eloise, Mich.) and S. R. Reuter. *Radiology* 97(2):367-370, 1970.

The area and maximum width of 25 normal gallbladders and 20 gallbladders in patients with extrahepatic obstructive jaundice (due to pancreatic or biliary carcinoma, cholelithiasis or pancreatitis) were measured; the mean area, width, and standard deviations were determined on the anteroposterior projections of celiac angiograms. The normal gallbladders ranged from 2 to 5 cm in width and from 11 to 33 cm^2 in area; the gallbladders in patients were dilated and ranged 4 to 8 cm in width and 35-67 cm^2 in area. Distended gallbladders also tended to have a slightly greater accumulation of contrast media than those of the normal group.

8704 A RAPID OCCULT BLOOD TEST USING AMIDOPYRINE AS OXYGEN ACCEPTOR. *(E.)* Crossley, G. (Bury Gen. Hosp. Lancashire, England). *J Med Lab Technol* 27(3):340-343, 1970.

A rapid and simple method for the detection of occult blood in the feces using amidopyrine as the oxygen acceptor was described and compared to the Hematest method. Amidopyrine in an acid-alcohol solution applied to a fecal smear on filter paper and followed by hydrogen peroxide produced a purple color within 1 min in a positive test and the sensitivity was decreased by increasing the acetic acid concentration of the amidopyrine solution (optimum sensitivity at 5 g amidopyrine, 100 ml 95% alcohol, and 50 ml 5% acetic acid). Amidopyrine was slightly less sensitive than Hematest (1 less dilution in the doubling dilution series) when compared on simple aqueous blood dilutions, but the results of both methods were closely parallel when fecal samples were used. The amidopyrine method was completely reproducible while Hematest occasionally gave a negative result on the same positive sample.

8705 ANGIOGRAPHIC DIAGNOSIS OF CARCINOMA OF THE PANCREAS. *(Ger.)* Lechner, G. (1st Med. U. Clin. Vienna, Austria), H. Pokieser, W. Zaunbauer and P. Brucke. *Fortschr Roentgenstr* 113(3):340-348, 1970.

The reliability of angiography for the diagnosis of pancreatic carcinoma in 16 patients was evaluated and the relevant literature was reviewed. Thirteen of 16 verified carcinomas of the pancreas were preoperatively diagnosed and one was diagnosed retrospectively. False negative diagnoses were made in 2 patients, and false positive diagnoses were made in 2 patients. Surgery of the latter 2 patients revealed a chronic fibrous pancreatitis, and normal pancreatic findings, resp. Of 178 cases described in the literature, pre-operative diagnosis based on pathological vascular changes was possible in 76% of the cases; the angiograms were normal even when evaluated retrospectively, in 24% of the patients. The extent of a carcinoma was difficult to determine by angiography; 5 out of 13 inoperable tumors quoted in the literature showed no angiographic evidence of extension into other organs.

8706 A TWO-STEP SCANNING METHOD IN LIVER CIRRHOSIS, BASED ON SPECIFIC HEPATIC FUNCTION. *(Ger.)* Locher, J. T. (U. Radiol. Inst., Basel, Switzerland) and M. Elke. *Schweiz Med Wschr* 100(38):1599-1603, 1970.

A two-step scan for diagnosis of liver disease was effectively used in two female patients with cirrhosis, after a previously used routine scintigraphic method failed to provide satisfactory information. The use of selenium 75-methionine (300 μC) which was quickly absorbed by the parenchymatous liver cells provided good scanning results, even in severe liver disease. The two-step scan considers the phagocytic capacity of the liver reticuloendothelial system for the first offered radiocolloid and, in addition, the utilization of protein synthesis with the aid of selenium 75-methionine. This method could be extended to a multi-phase scan by using several different radiopharmaceuticals.

8707 LIVER ANGIOGRAPHY: EXPERIMENTAL STUDIES ON THE PROBABILITY OF DETECTION OF LIVER METASTASES. *(Ger.)* Georgi, M. (Czerny Hosp., Heidelberg, Germany). *Strahlentherapie* 140(1):108-112, 1970.

The detection of liver metastases as related to attainable concentrations of contrast media at the parenchymal level was studied by phantom tests. Low dosages of contrast media (20 ml of 60% urographin) allowed detection of 3 cm size defects and were satisfactory for portal hypertension diagnosis. However, best results in the detection of liver metastases were obtained by direct portography. Parenchymal contrast medium concentrations as low as 1% allowed the detection of defects 1 cm of size, even in thicker portions of the liver, in clinical experience. The method is suggested for use in the detection of liver metastases.

8708 THE DETECTION OF GASTRIC ACIDITY IN PREGNANCY ANEMIA. *(E.)* Beazley, J. M. (Northern Gen. Hosp., Sheffield, England). *Brit J Clin Pract* 24(9):372-374, 1970.

Gastric acidity was studied using a tubeless method (caffeine sodium benzoate as a gastric stimulant and Diagnex-blue as an indicator) in 100 consecutive patients with pregnancy anemia. No permanent achlorhydria was detected although it was suspected in 25 patients after investigation with Diagnex-blue. On repeating the test with histamine, achlorhydria was again discovered in 7 of these patients. Three of them aged more than 35 yr with megaloblastic anemia, subsequently had a test meal augmented with histamine which revealed hypochlorhydria. Tubeless gastric analysis can be a useful screening test in pregnancy anemia.

8709 RELIABILITY OF GASTROSCOPY AND CYTOLOGY FOR THE DIAGNOSIS OF CARCINOMA OF THE STOMACH. *(Ger.)* Halter, F. (Med. Clin. U. Berne, Switzerland), M. Gander, G. Miller and P. A. Gretillat. *Schweiz Med Wschr* 100(28):1220-1221, 1970.

The diagnostic accuracy of gastroscopy and exfoliative gastric cytology was compared in 176 combined examinations in 1160 patients. Clinical evaluation revealed 27 invasive carcinomas (22 verified by laparotomy) and 5 carcinomas *in situ*. One invasive carcinoma and 2 carcinomas *in situ* were diagnosed by positive gastric cytology alone; on the other hand, 16 invasive carcinomas and one carcinoma *in situ* produced negative cytological results. The benign lesions in the operated group (32 out of 59) and in the non-operated patients (92) were mainly peptic ulcers (48), erosive gastritis (15) and cases without definite stomach lesions (46). The percentage of false negative results was 12.5% for gastroscopy and 53.1% for exfoliative cytology; either procedure gave false positive results.

8710 INFUSION CHOLANGIOCHOLECYSTOGRAPHY. *(Ger.)* Crocella, A. (Olga Basilewsky Hosp., Florence, Italy), U. Nannelli, S. Bruno and G. Vita. *Fortschr Roentgenstr* 113(3):359-366, 1970.

The advantages of infusion cholangiocholecystography in comparison to the customary i.v. cholangiocholecystographic procedures based on 486 cases were described. The infusion cholangiocholecystography, in contrast to the standard i.v. procedure in which 40% glucose is used, was performed by slow i.v. infusion (30 min to 60 min) of 200-250 ml of 5% isotonic glucose solution, mixed with 20-40 ml Biligrafin forte or Bilivistan. The use of 5% glucose caused increased concentration of the contrast medium in the bile and earlier, more intense and complete visualization of the total extrahepatic biliary system. Slow administration reduced the incidence of side effects and also the amount excreted by the kidneys.

8711 MICROGASTROFIBERSCOPE: A NEW DEVICE IN DIAGNOSIS OF GASTRIC CANCER BASED ON DISSECTING MICROSCOPE FINDINGS. *(E.)* Suzaki, T. (Tenri Hosp., Japan), T. Miyake, Y. Yamamoto, J. Ariyoshi, H. Furukawa and K. Hajiro. *Jap Arch Intern Med* 17(2):27-39, 1970.

The appearance of the gastric mucosal surface and of capillaries as seen with a dissecting microscope are described in the differential diagnosis of gastric carcinoma using a trial model of a microgastrofiberscope. A gastrofiberscope fitted with a cylindrical hood on its tip (filled with water to fix the focus and eliminate halations) was introduced through a channel inside a masterscope and used for endoscopic observation of the gastric mucosa. Adenocarcinoma was characterized by the abnormal deformation of gland openings and reticulate capillaries while carcinoma simplex was characterized by a smooth structureless surface with irregularly sized and distributed blood vessels. Normal gastric epithelium was smooth and glossy with both gland openings and capillaries uniform in size and distribution while adenomatous polyps show uniformly-sized gland openings but no clearly visible capillaries.

8712 PERORAL BIOPSY OF SMALL INTESTINAL MUCOSA: II. FIRST RESULTS. *(Fr.)* Kissel, F. (C.H.U., Nancy, France), G. Rauber and F. Vicari. *Ann Med Nancy* 9(2):101-105, 1970.

GASTROINTESTINAL DISEASES

ESOPHAGUS

791 RESULTS OF RADIATION THERAPY WITH HIGH SINGLE DOSES FOR ESOPHAGEAL CARCINOMA.
Ger.) Balmuchanov, S. B. (Res. Inst. Oncol. Radiol.,
ma Ata, USSR), K. I. Zolkiver, A. S. Smagulov,
Z. Szetteev, L. I. Musabaeva, Z. N. Abdrachmanov
d A. T. Turganbaev. *Radiobiol Radiother* 11(3):
25-234, 1970.

esults of 2 types of radiation treatment of esopha-
eal carcinoma were compared in 2 groups of male and
emale patients, aged 40-70; leukocyte and lymphocyte
ounts were carried out before, during and after
reatment; all patients received 'hemostimulating'
erapy (blood transfusions, infusions with leuko-
tes and drugs). The patients in Group 1 (100)
ceived high single doses (600-800 r every 3-4 days,
tal dose 3500-4500 r), while Group 2 (113 patients),
ceived daily radiation (single dose 150-200, total
se 6000-8000). The extent of the tumor was on
e average more than 6 cm, but could not be deter-
ned in 12 patients of Group 1 due to the almost
mplete obturation of the esophageal lumen. In
l cases in which the extent of the tumor was more
an 10 cm, or in which distant metastases were
esent, the disease was classified as 'Stage IV'
l patients of group 1); the other 69 patients
re classified as 'stage III'. In Group 2, 28%
the patients (32) were classified as 'stage IV',
d the remaining 81 patients as 'stage III'.
oup 2 was considered the control group and differed
ly slightly in sex and age distribution, as well
in regard to location and severity of the tumor.
tastases were radiologically determined in 25%
the patients in group 2 and in 21% of the patients
group 1. The results of the radiation treatment
re good or satisfactory in 91% of group 1 and in
% of the patients in group 2. The difference in
sults was highest in the first yr after termina-
on of treatment and decreased thereafter; the
an survival time for patients of group 1 was 10.3
nths and 6.4 months for patients of group 2.

8827 HYPERTROPHY OF THE PYLORIC AND ANTRAL MUSCLE IN THE ADULT. *(Ger.)* Schmitt-Koppler, A. (Surg. U. Clin. Mainz, Germany), H. Brunner and C. P. Ehlert. *Langenbeck Arch Chir* 326(4):355-366, 1970.

Hypertrophy of the pyloric muscle and the antrum, associated with gastric or duodenal ulcer, was seen in 13% of patients operated during the last 2 yr. Clinical symptoms, and radiological investigation showed elongation and narrowing of antrum and pylorus with the lips of the pylorus protruding spike-like into the duodenal bulb. Differential diagnosis between benign hypertrophy and malignancy was often difficult.

8828 PYLORIC SPHINCTER INCOMPETENCE IN MAN: A PHYSIOLOGICAL VARIANT. *(E.)* Beneventano, T. C. (Montefiore Hosp., Bronx, N.Y.) and C. J. Schein. *Gastroenterology* 59(4):518-521, 1970.

Thirty-six consecutive cholecystectomized female patients with indwelling T-tubes were examined for pyloric sphincter competence by a cineradiographic technique. Sodium diatrozoate (50%) was passed through a T-tube to fill the duodenum and the duodenal bulb. Twelve patients (33 1/3%) demonstrated pyloric insufficiency with regurgitation of the contrast material through the sphincter into the stomach. None of the patients with regurgitation were symptomatic or had roentgen or direct observation disease of the stomach or duodenum. Pyloric sphincter incompetence appears to be a physiological variant in some individuals.

8829 PRODUCTION OF LEUKEMIA AND STOMACH NEOPLASMS IN SWISS, RF, BALB/c, AND C3H FEMALE MICE BY FEEDING N-[4-(5-NITRO-2-FURYL)-2-THIAZOLYL] ACETAMIDE. *(E.)* Cohen, S. M. (U. Wisconsin Med. Sch., Madison), E. Erturk and G. T. Bryan. *Cancer Res* 30(9):2320-2325, 1970.

The survival rate, latent period, and incidence of lymphocytic leukemia and the incidence of stomach neoplasms were determined in Swiss, RF, BALB/c, and C3H female mice fed N-[4-(5-nitro-2-furyl)-2-thiazolyl] acetamide (NFTA). Only 16 Swiss mice fed NFTA (490 mg/mouse/13 weeks) in an initial test survived and in gross and microscopic examination 15 had generalized lymphocytic leukemia and 3 had forestomach squamous cell tumors while none of the 51 control mice (surviving 14 to 49 weeks) developed leukemia or any other tumors. In a 14 week dosage study on Swiss mice, a 12 week latent period for the leukemia was observed at 0.1 and 0.05% dietary levels of NFTA with incidences of 8/9 and 9/13 resp., and an 18 week latent period was observed at 0.025 and 0.01% dietary levels with incidences of 8/16 and 7/14, resp. Stomach tumors were found in 12/52 mice with 6 of these incidences occurring in the highest dosage range (0.1%). After 14 weeks on a 0.1% NFTA diet, leukemia was widespread in RF (12/16), BALB/c (21/29), C3H (12/24), and Swiss (22/22) strains of mice while only 3 controls (all of the RF strain) developed leukemia, and 13 mice fed NFTA displayed stomach tumors while none of the controls were afflicted.

8830 CONGENITAL MEMBRANOUS STENOSIS OF THE DUODENUM AND THEIR IMPORTANCE IN ADULTS: CONTRIBUTION TO THE PATHOGENESIS OF INTRADUODENAL DIVERTICULUM. *(Ger.)* Holder, E. (St. Hosp. Nuremberg, Germany), E. Messmer and W. Wenz. *Langenbeck Arch Chir* 326(4):287-305, 1970.

Membrane stenosis of the duodenum in a 19-yr-old male and in a 40-yr-old female patient were reported. A moderate ring-like stenosis due to delicate membrane formation was radiographically diagnosed in the female patient who was treated conservatively. The male patient showed radiologically a greatly distended duodenum, and a stenosis in the 3rd, horizontal part of the duodenal loop. During surgery, a palm-sized duodenal membrane with central opening of 3 to 4 mm diameter was removed. The symptoms, which had existed for 6 yr, disappeared promptly and the enlargement of the duodenum was greatly reduced 2 weeks after the operation.

8879 ALCIAN BLUE BINDING PROPERTIES OF GASTRIC JUICE. *(E.)* Piper, D. W. (Roy. North Shore Hosp., Sydney, Australia), D. Whitecross, P. Leonard and A. Clarke. *Gastroenterology* 58(4):534-538, 1970.

Alcian blue binding properties were studied by a precipitation method at pH 5.8 in 10 normal subjects and in 13 patients with gastric ulcer, 7 patients with duodenal ulcer and 6 patients with gastric carcinoma. Gastric juice of peptic ulcer patients was characterized by an increased ability to bind the anionic dye Alcian blue and there was a qualitative change in gastric juice of patients with chronic peptic ulcer, especially chronic duodenal ulcer. The gastric juice of duodenal ulcer patients differed from that of controls whether dye binding was expressed in terms of gastric juice volume, protein content, or sialic acid content at the higher dye concentration. The gastric juice of gastric ulcer patients differed from controls when dye binding capacity was expressed in terms of volume of gastric juice both at low and at high dye concentrations. The carcinoma group did not differ statistically from controls, nor did the gastric ulcer group differ statistically from the duodenal ulcer group. If excess dye binding is due to abnormality of mucous secretion (associated with peptic ulceration), several explanations are possible: First, abnormal mucous may seemingly less effectively protect the mucosa by its mechanical or antipeptic actions. Second, abnormal mucous may indicate a biochemical abnormality of gastric mucosal cells. Third, changes observed in gastric juice may be secondary to ulceration.

8880 SELECTIVE VAGOTOMY OF THE PARIETAL CELL MASS PRESERVING INNERVATION OF THE UNDRAINED ANTRUM: A PRELIMINARY REPORT OF RESULTS IN PATIENTS WITH DUODENAL ULCER. *(E.)* Amdrup, E. (Commun. Hosp., Copenhagen, Denmark) and H. E. Jensen. *Gastroenterology* 59(4):522-527, 1970.

Selective vagotomy of the parietal cell mass preserving the innervation of the undrained antrum was described in 22 patients with hyperacidity and duodenal ulcer. No postoperative complications or gastric stasis, ulcer pain, acid regurgitation dumping, or diarrhea have occurred. Repeated survey exposures and cinematography in 14 patients demonstrated no change in antral motility and gastric emptying. The fasting secretion volume (15 min aspirate immediately after intubation) was reduced 39%; the basal secretion (aspirate over 1 hr) showed an 87% reduction in acid content. The reduction in pentapeptide activated acid secretion was 62%, and spontaneous acid secretion and insulin-provoked acid secretion was reduced by about 90%. Early results of surgical procedure were promising in that ulcer pain and acid regurgitation have been completely relieved.

SMALL INTESTINE

8896 BACTERIAL MODIFICATION OF TAUROCHOLATE DURING ENTEROHEPATIC RECIRCULATION IN NORMAL MAN AND PATIENTS WITH SMALL INTESTINAL DISEASE. *(E.)* Garbutt, J. T. (Duke U. Med. Ctr., Durham, N.C.), R. M. Wilkins, Lack, L. and M. P. Tyor. *Gastroenterology* 59(4):553-566, 1970.

The bacterial metabolism of the primary bile acid, taurocholate, was studied during enterohepatic circulation in 18 patients with ileal disorders, 5 patients with disorders primarily involving the proximal small intestine, and 4 student volunteers serving as controls. Following i.v. taurocholate-24-^{14}C, the chemical composition of the total ^{14}C radioactivity was determined in serial samples of duodenal fluid. Modification of taurocholate contributed materially to maintenance of enterohepatic circulation of bile acids in normal adults, and administration of tetracycline reduced enterohepatic circulation. The major transformation was deconjugation *per se*, resulting in presence of reconjugated trihydroxy bile acids in the enterohepatic space. In patients with severe ileal disorders, there was loss of capacity to recirculate not only taurocholic acid, but also its metabolized products. The presence of small bowel stasis enhanced the ability of some patients to recirculate small amounts of metabolized bile acids (glycine conjugate); obstructive bowel diseases favored the production of deoxycholic acid. In patients with Whipple's disease and nontropical sprue, the chief modification involved deconjugation and 7-δ-dehydroxylation, resulting in deoxycholic acid conjugates, whereas in patients with "blind loop" syndrome, deconjugation resulted mainly in cholic acid. An intact ileal transport mechanism appears to be of importance in maintaining enterohepatic circulation of primary and secondary bile acids.

8897 SMALL BOWEL INTUSSUSCEPTION DEMONSTRATED BY ORAL BARIUM. *(E.)* Wiot, J. F. (U. Cincinnati Med. Ctr., O.) and H. B. Spitz. *Radiology* 97(2):361-366, 1970.

Four cases (adults) of small bowel intussusception were studied roentgenographically, using p.o. barium. Roentgen characteristics showed the proximal intestine greatly dilated with a sudden beak-like change in caliber at the site of obstruction as the central canal of the intussusceptum fills. The central canal was visualized for only a short distance if the obstruction was complete; with incomplete obstruction, a longer segment of the central canal was demonstrated. The lead mass when present (in 2 of the 4 cases reported) was shown as the barium passed through the central canal and entered the normal bowel distal to the lesion. Diagnostic difficulty occurred when edema was severe enough so that there was complete proximal obstruction and the central canal failed to fill. The cause of small intestinal obstruction cannot be distinguished roentgenographically although diagnosis of this condition can be made from a barium study.

SMALL INTESTINE

Regional Enteritis

8921 SYMPTOMATIC HYPOMAGNESEMIA COMPLICATING REGIONAL ENTERITIS. *(E.)* Kirsner, J. B. (Dept. Med., U. Chicago, Ill.), D. A. Morowitz and K. Gerlach. *Gastroenterology* 59(4):567-574, 1970.

The pertinent clinical features were described for four male and female patients aged 42 to 54 yr, with Crohn's disease of the small bowel, or small bowel and colon, and who also developed symptomatic hypomagnesemia with symptoms and signs similar to those induced in experimental animals by magnesium-deficient diet. The clinical features of magnesium deficiency in the patients were widely variable and were poorly correlated with plasma magnesium levels. Symptoms and signs were non-specific and varied from mild hyperirritability and paresthesia to coma and grand mal seizures. Other signs and symptoms included positive Babinski responses, tetany, muscular tremor, athetoid movements, weakness, vertigo, confusion and hallucinations. Patients with inflammatory bowel disease were disposed to the development of hypomagnesemia either as a result of the underlying disease or as a consequence of therapy with mercurial diuretics or corticosteroids. The symptoms of hypomagnesemia are reversible, and therapy consists of injections of magnesium sulfate (50%, 1 g every 3 to 6 hr until improvement occurs) to replace the large total body deficit.

Malabsorption

8928 INDICATOR DILUTION STUDIES IN THE SMALL BOWEL OF PATIENTS WITH CHOLERA DIARRHEA: II. COMPARISONS OF ABSORBABLE AND "POORLY ABSORBABLE" SUBSTANCES. *(E.)* Brigham, K. L. (Vanderbilt U., Sch. Med., Nashville, Tenn.), J. G. Banwell, N. F. Pierce, R. C. Mitra, D. S. Fedson and A. Mondal. *Johns Hopkins Med J* 127(2):107-118, 1970.

Comparisons of absorbable and poorly absorbable substances in the small bowel of patients suffering from acute cholera and during convalescence were made using the indicator dilution technique. Chromium^{51}-labeled EDTA exhibited larger areas on the time-concentration curve than did BSP in both the jejunal and ileal segments suggesting that chromium^{51} EDTA may be a better marker substance. When Co^{57}-labeled vitamin B_{12} was used with BSP in the jejunum, the areas were more comparable (both substances may be equally reliable as markers in this segment) but the mean transit times and volumes were slightly greater for BSP (9.75 and 61.60, resp.) than for vitamin B_{12} (8.82 and 56.12, resp.). In the ileal segment the ratio of vitamin B_{12} area to BSP area was less than 1 in 4 out of the 6 studies indicating that the vitamin B_{12} was absorbed; this ratio decreased during convalescence period indicating that more vitamin B_{12} was lost from the segment during that time. In 4 out of 5 studies with vitamin B_{12} and d-xylose, the ratio of d-xylose area to vitamin B_{12} area was less than 1 in the jejunum (indicating that d-xylose was lost from the system during transit through the test segment) and this ratio was apparently linearly related to segment volume (the loss of d-xylose was greater with increasing volume).

8929 INTESTINAL DIPEPTIDASES AND DISACCHARIDASES IN CELIAC DISEASE IN ADULTS. *(E.)* Lindberg, T. (Dept. Path., U. Lund, Sweden), N. O. Berg, A. Dahlqvist and A. Norden. *Gastroenterology* 59(4):575-582, 1970.

Intestinal dipeptidases (8 substrates) and disaccharidases (5 substrates) were studied in 12 patients with celiac syndrome who improved on gluten-free diet and in 6 patients with a similar disorder who failed to improve on a gluten-free diet; 37 patients with histologically normal intestinal mucosa served as controls. All enzyme activities were reduced in both the gluten responsive and the nonresponsive celiac group. Peptidyl-proline dipeptidase activities were reduced to approximately 30% of mean activities in control group and the other dipeptidase activities to about 50%. Most patients in the non-treated group showed low or subnormal dipeptidase activities on glycyl-L-leucine (48% of corresponding mean values for reference group), glycyl-L-valine (52%), L-alanyl-L-glutamic acid (55%), L-valyl-L-glutamic acid (51%) and L-glutamyl-L-valine (30%). No differences occurred between the gluten and non-gluten responsive groups. In 6 patients following a strict gluten-free diet, the increase in activity was statistically significant for all peptidases with the exception of two peptidyl-proline dipeptidases (L-valyl-L-proline (29%) and L-glutamyl-L-proline (33%)); the disaccharidase activities corresponded to 10-20% of these values in the control group. After the gluten-free diet, the responsive group showed only slight improvement in the peptidyl-proline dipeptidase, maltase (25%), isomaltase (20%), and sucrase (21%) activities, whereas the other dipeptidase activities increased considerably. Trehalase and lactase were unchanged during the observation period. The decrease of intestinal disaccharidases and dipeptidases found in celiac disease is seemingly a phenomenon secondary to the primary damage of the mucosa.

LARGE INTESTINE

8940 ENZYME CYTOCHEMICAL AND ISOENZYME STUDIES OF NORMAL AND DISEASED RECTAL MUCOSA. *(E.)* Klein, U. E. (1st Med. Dept., U. Kiel, Germany) and H. C. Drube. *Amer J Proctol* 21(5):346-351, 1970.

Isoenzyme fractions of alkaline phosphatase, which is not traceable in normal or diseased rectal epithelium, were detected in homogenates of rectal carcinomatous tissue by electrophoretic analysis. Similar tumor phosphatase fractions appeared in the plasma of two patients. Some enzymes marking cellular organelles (non-specific esterase, succinate dehydrogenase and thiamine pyrophosphatase), when demonstrated cytochemically, showed different distribution patterns in normal rectal mucosal epithelium and in adenocarcinomas of the rectum. The appearance of a tumor-specific isoenzyme of alkaline phosphatase may lead to new diagnostic methods.

8941 MYXEDEMA CAUSING ADYNAMIC ILEUS, SEROUS EFFUSIONS, AND INAPPROPRIATE SECRETION OF ANTIDIURETIC HORMONE. *(E.)* Liechty, R. D. (U. Iowa Hosp., Iowa City), R. F. Miller and W. N. Cohen. *Surg Clin N Amer* 50(5):1087-1098, 1970.

Examination of a 48-yr-old woman with myxedema revealed the presence of three uncommon complications of hypothyroidism and myxedema: paralytic ileus, serous effusions and water intoxication. A preliminary diagnosis of pelvic carcinoma was made based upon the signs of bowel obstruction resulting from the paralytic ileus, pleural and peritoneal effusions resulting from the water and electrolyte imbalance, and the presence of an unrelated pelvic mass. The patient also showed a remarkable capacity to absorb large quantities of enema fluids, despite gross overhydration. The lowered serum sodium and the myxedematous water intoxication and serous effusions were related to an excessive secretion of anti-diuretic hormone (ADH). The patient was treated with thyroid hormone replacement and all secondary signs and symptoms of myxedema complications were reversed and disappeared.

LARGE INTESTINE

Ulcerative Colitis

987 AN EXPERIENCE OF ULCERATIVE COLITIS: II. SHORT TERM OUTCOME. *(E.)* Sircus, W. Western Gen. Hosp., Edinburgh, Scotland), K. N. alan, R. J. Prescott, W. I. Card, J. P. A. McManus, . W. A. Falconer, W. P. Small, A. N. Smith and J. ruce. *Gastroenterology* 59(4):589-597, 1970.

The outcome of the first referred attack of ulcerative colitis was examined in relation to age, sex, severity, attack state, duration of disease, extent of involvement, complications, and hematological or biochemical abnormalities in 399 patients seen from 1950 to 1967 inclusive. Mortality increased with increasing age in severe cases (13% mortality from 0 to 24 yr, 26.9% from 25 to 49 yr, and 35.5% from 50 yr), but there was no significant difference between the sexes. Only 1 death (2.6%) occurred when the disease was mild or moderate, but 18 deaths (28%) occurred in severe cases, and higher mortality rates were associated with patients afflicted for less than 3 months (34.1%) than with the rest of the patients (13.6%) while the attack state, total length of history, and the degree of involvement apparently had no effect. Hypokalemia, increased alkaline phosphatase, and hypoalbuminemia, and liver disease (pericholangitis, cirrhosis, or fatty infiltration) were associated with increased mortality rates, but anemia, leucocytosis, eosinophilia, associated diverticular disease, ankylosing spondylitis, colitic arthropathy, and clubbing of the fingers had little effect on mortality.

8988 AN EXPERIENCE OF ULCERATIVE COLITIS: III. LONG TERM OUTCOME. *(E.)* Sircus, W. (Western Gen. Hosp., Edinburgh, Scotland), K. N. Jalan, R. J. Prescott, W. I. Card, J. P. A. McManus, M. B. Falconer, W. P. Small, A. N. Smith and J. Bruce. *Gastroenterology* 58(4):598-609, 1970.

The long-term prognosis of ulcerative colitis was determined by following the progress of 399 patients over 4 attacks with reference to the extent of ulcer involvement and the severity of each attack relative to the first referred attack, and long-term survival rates were calculated. Higher mortality rates were associated with increasing age at the time of the first referred attack (28.3% at 50 + yr compared to 7.4-15.0% below 50), the chronic continuous form of the disease (25.0% compared to 14.1% for the intermittent form), and increasing severity of the attack (31.6% compared to 15.5% for moderate and 4.5% for mild attacks). Radiological determination of the extent of involvement in at least 2 attacks per patient suggested an increase in the extent of involvement with subsequent attacks and correlation of the extent of the involvement with the severity of the first referred attack indicated that patients with entire involvement have a significantly higher proportion of mild subsequent attacks than those with partial involvement. Mortality rates were higher for patients moderately ill (2.49%) than for those severely (1.32%) or mildly (0.83%) ill and higher for patients with entire involvement (2.81%) than for those with only partial involvement (1.11%). The mortality for all patients with ulcerative colitis was 10% during the first year but after that fell to the normal expected fatality rate of 1%/yr. Patients undergoing surgery in the first attack had a higher mortality during the first yr due to immediate postoperative death, but the rates were high in later yrs. Patients with mild cases exhibited a survival rate with lower mortality than was observed for the general population; while patients with severe cases exhibited an initial high mortality rate which was reduced until after 10 yr at which time the curve was comparable to the moderately ill group.

PANCREAS

002 HISTOLOGICAL CHANGES IN THE PANCREAS AFTER STOMACH OPERATIONS. *(Ger.)* Maier,
. (Path. Anat. Inst., U. Erlangen-Nuremberg, Germany)
nd K. Elster. *Z Gastroent* 8(5):291-303, 1970.

he histology of the pancreas after stomach operaions was investigated in 50 patients, 2/3 of whom ere operated on for duodenal or gastric ulcer, nd 1/3 for gastric carcinoma; the results were comared with findings obtained from 50 autopsy cases ithout obvious gastric disorders. Pancreatic fibrosis, inflammation and changes in the duct system, uch as dilation, retention of secretion and inreased size of papillary folds occurred twice as ften in patients who had undergone stomach operaions than in those who had not, but pancreatic ipomatosis was noted more often in the latter group. hese changes which are sometimes localized may be issed in diagnostic biopsy or postmortem preparaions of small pieces of pancreas.

9003 TWO-STAGE PROCEDURE FOR TOTAL PANCREATECTOMY IN THE RAT. *(E.)* Migliorini, R. H. (Sch.
Med. Ribeirao Preto, San Paulo, Brazil. *Diabetes*
19(10):694-697, 1970.

A method for pancreatectomizing rats in two stages was described. In the first stage, most of the gland was excised, including the pancreatic lobes along the bile duct and a small portion, sufficient to prevent the appearance of diabetes, was left near the spleen. In the second stage, performed several weeks later, the remaining pancreas was removed rapidly, with minimal surgical trauma and immediate onset of severe diabetes. Blood glucose increased to 207 mg/100 ml 2 hr after the operation and to 553 mg/ml at 24 hr, and the plasma free fatty acid levels increased abruptly and peaked at 1.89 μEq/ml after 2 hr. Plasma acetoacetate reached 48 mg/100 ml, and plasma triglycerides increased to 8.3 μmole/ml after 24 hr. This preparation appears to be very suitable for studying the metabolic effects of acute insulin deprivation.

PANCREAS

Pancreatitis

9015 DIAGNOSIS AND COURSE OF CHRONIC PANCREATITIS AND OF CHRONIC RELAPSING PANCREATITIS. *(Ger.)* Creutzfeldt, W. (Med. U. Clin. Gottingen, Germany), H. Fehr and H. Schmidt. *Schweiz Med Wschr* 100(28):1180-1189, 1970.

Clinical findings in 60 cases of chronic pancreatitis and of chronic relapsing pancreatitis investigated between 1964 and 1969 were compared with those seen in 42 cases of 2 other hospitals, and with literature reports. Diagnosis was based on progressive reduction of functional capacity and morphological changes as expression of permanent damage to the pancreas. Major diagnostic procedures were enzyme tests, especially the pancreozymin-secretin test, which yielded positive results in 45% of the cases, radiology, which revealed calcification in 33% and histo-pathological investigation of biopsy material, which confirmed the diagnosis in 22%. Alcoholism was present in 38% of all patients and in 55% of patients with calcifications. Two cases with pancreatitis of 17 years duration had both calcifications and carcinoma of the pancreas. Therapeutic operative procedures were carried out in 25 patients; laparotomy was performed twice in 9 patients and 3 times in one patient in order to alleviate pain.

LIVER AND BILIARY TRACT

9038 HISTOLOGY OF THE LIVER IN CONGENITAL FRUCTOSE-INTOLERANCE DURING TREATMENT WITH DIET. *(Ger.)* Lelong, M. (Paris, France), D. Alagille, LeT. Vinh, M. Gautier and M. Odievre. *Monatsschr Kinderheilk* 118(6):257-258, 1970.

The development of histological changes of the liver was investigated in 9 cases of congenital fructose intolerance. Comparative liver biopsies were performed before and during therapy with a diet free of fructose, and the diagnosis was in all cases confirmed by biochemical methods and by fructose-load tests, and was arrived at 1½ to 7 months after birth. The clinical symptoms were vomiting, hypoglycemia, hypertrophy of the liver, manifestations of deficient nutrition with slow weight gain and retardation of growth. Clinical manifestations subsided within weeks after the start of a fructose-free diet, and weight gain and growth rate normalized. Enlargement and increased density of the liver remained at least for 2 yr, and histological changes persisted despite normalization of clinical findings. Repeated liver biopsies showed the presence of fibrosis and steatosis initially; then fibrosis subsided while steatosis remained clearly demonstrable in all cases. The prescribed diet appeared to disturb the metabolic balance, and persistent hypercholesterolemia indicated a relative lack of carbohydrates; a restrictive diet may not be adequate and additional daily administration of glucose may provide sufficient calories and a better nutritional balance.

9039 THE ULTRASTRUCTURE OF THE LIVER IN PATIENTS WITH CHRONIC IDIOPATHIC JAUNDICE. *(Ger.)* Feldmann, G. (Hosp. Beaujon, Clichy, France), G. Molas, O. Groussard and M. C. Domart-Oudea. *Munchen Med Wschr* 112(39):1725-1729, 1970.

Fourteen patients with chronic idiopathic jaundice, originating from Gilbert's disease (10), Rotor syndrome (2) and Dubin-Johnson syndrome (2) were investigated. Histological findings were normal in all cases of Gilbert's disease and Rotor syndrome, but numerous pigment accumulations of various sizes were found in patients with Dubin-Johnson syndrome. Electron microscopy showed major or minor abnormalities of liver mitochondria in 8 cases of Gilbert's disease and in 1 case of Rotor syndrome, while none were found in Dubin-Johnson syndrome. The changes of the hepatic cells were characterized by the occurrence of linear and dot-shaped paracrystalline inclusions in normal- and over-sized mitochondria, and several types of pigment were found in the cytoplasm. The abnormalities were non-specific and occurred irregularly; their presence did not contribute to the elucidation of the pathophysiology of these types of jaundice.

9040 GLUCURONIDIZATION OF ^{131}I-o-IODOBENZOIC ACID: A MEASURE OF DETOXIFICATION FUNCTION OF THE LIVER. *(Ger.)* Dohnalek, J. (Med. Fac. U. J. Ev. Purkyne, Brno, Czechoslovakia), M. Eysselt, K. Martinek, D. Kadlecova, B. Herufek. *Acta Hepato-splen* 17(4):250-254, 1970.

Glucuronide formation was studied 6 hr after labeled ^{131}I-o-iodobenzoic acid administration (2 mg p.o.) in 94 healthy subjects, 75 patients with chronic hepatitis, 62 patients with cirrhosis, 47 patients with chronic alcoholism, 47 patients with cholecystitis, 42 cholecystectomized patients and 12 patients with liver metastases. Such data were compared with BSP- and ^{131}I-rose bengal tests. Increased glucuronide formation was observed in all patients with cirrhosis and liver metastases, and high glucuronide formation occurred in patients with chronic hepatitis (75% of the cases), in patients with compensated and decompensated liver cirrhosis (68 and 83% of the cases, resp.) and in patients with chronic cholecystitis (36%). Intensification of glucuronide formation seems to be related to an impairment of glycine conjugation and appears to reflect an alteration of the detoxification function of the liver in conditions of chronic parenchymal damage.

9041 SERUM CHOLESTEROL ESTERIFICATION IN LIVER DISEASE: IMPORTANCE OF LECITHIN-CHOLESTEROL ACYLTRANSFERASE. *(E.)* Simon, J. B. (Dept. Med. Queen's U., Kingston, Ontario, Canada) and R. Scheig. *New Eng J Med* 283(16):841-846, 1970.

Serum lecithin-cholesterol acyltransferase (LCAT) activity was assayed by measuring the ability of serum to esterify labeled substrate cholesterol in 12 healthy subjects and in 21 patients with liver disease. Serum LCAT activity (μg cholesterol esterified/ml/hr) ranged from 20.4 to 34.1 in the controls (mean of 27.6), was low (5-20) in 14 patients, normal (20-35) in 6, and high (59.6) in

1. Serum SGOT levels and the degree of necrosis corresponded to the LCAT activity impairment in patients with acute hepatitis but not in patients with chronic liver disease. A direct relation (r = 0.647) existed between LCAT activity and the proportion of esterified serum cholesterol since 14 patients with low LCAT activity also had less than 65% of total cholesterol in the esterified form, and 4 patients with normal LCAT activity had more than 65% esterified. Incubation of serum substrate prepared from normal subjects with the serum from patients or of patients' substrate with normal serum did not affect LCAT activity so that the decrease in activity was apparently not due to circulating LCAT inhibitors or to abnormal substrate lipoproteins.

9042 THE INCIDENCE AND FREQUENCY OF MALLORY BODIES IN 1100 CONSECUTIVE LIVER BIOPSIES. *(E.)* Christoffersen, P. (Commun. Hosp. Copenhagen, Denmark). *Acta Path Microbiol Scand* 78A(4):395-400, 1970.

The incidence of Mallory bodies in liver diseases was studied on 1,100 consecutive needle biopsies out of which 62 were positive. Of these 17 (corresponding to 7% of the total number of specimens) showed fatty infiltration, and 45 (corresponding to 37%) showed cirrhosis and fatty infiltration, while Mallory bodies were not demonstrated in biopsies without fatty infiltration. The incidence of Mallory bodies in nonselected materials of cirrhosis with fatty infiltration appeared to be between 25 and 40% and was independent of the degree of fatty infiltration.

9043 ISOLATION AND CHARACTERIZATION OF KERATAN SULFATES FROM THE LIVER OF A PATIENT WITH G_{M1}-GANGLIOSIDOSIS TYPE 1. *(E.)* Callahan, J. W. (Dept. Biochem., McGill U., Montreal, Quebec, Canada) and L. S. Wolfe. *Biochim Biophys Acta* 215(3):537-543, 1970.

Liver samples obtained at autopsy from cases of infantile G_{M1}-gangliosidosis Type I contained increased amounts of G_{M1}-ganglioside. β-Galactosidase enzyme activity measured at pH 5.0 was exceedingly low (0.01 as compared to 0.6 µmole/min/g wet weight at 37°C in normal conditions) whereas several other lysosomal hydrolases had activities greater than normal; β-N-acetyl-glucosaminidase was 17.7 as compared to 2.4 µmole/min/g wet weight at 37°C in normals. The glycosaminoglycans which accumulated in greatly increased amounts in the liver were shown to contain galactose and glucosamine as the major carbohydrate constituents with a molar ratio of galactose to glucosamine greater than unity. These compounds were highly water-soluble, had a very low sulfate content, were polydisperse on molecular sieve chromatography, and contained an alkali-labile protein-polysaccharide linkage region. Except for a low sulfate content, these galactose-glucosamine-containing polysaccharides are similar to human cartilage keratan sulfate. Abnormal linking of protein-polysaccharide complexes mediated by specific glycoprotein units may constitute the basis of chondrodystrophy in infants with this disease. Hepatomegaly seems to be due to excessive accumulation of keratan sulfates; however, the site of synthesis of these undersulfated polysaccharides is unknown.

9044 THE SERUM COMPLEMENT IN SOME ACUTE AND CHRONIC LIVER DISEASES. *(It.)* Farini, R. (Dept. Med., U. Padua, Italy), P. F. Gambari, U. Fagiolo, A. Castellani, A. Rizzo, G. Erle and R. Naccarato. *G Clin Med* 51(5):411-423, 1970.

Acute Nonviral Hepatitis and Hepatic Injury

9093 CORRELATION OF RADIATION-INDUCED ULTRASTRUCTURAL CHANGES IN MOUSE HEPATOCYTES WITH ALTERATIONS IN PLASMA CONCENTRATION OF PROTEIN-BOUND NEUTRAL HEXOSES. *(E.)* Rene, A. A. (Armed Forces Radiobiol. Res. Inst., Bethesda, Md.) and A. S. Evans. *Radiat Res* 44(1):224-236, 1970.

Alterations in liver tissue and in plasma concentration of protein-bound neutral hexoses induced in mice (strain C_3H) subjected to a whole-body dose of 530 rads of mixed gamma-neutron radiations delivered at a rate of approximately 20 rads/min were reported. The blood plasma concentration of protein-bound carbohydrates, as neutral hexoses, estimated daily after irradiation, increased 1.8-2.2 times their preirradiation levels in animals which died, but not in survivors. Ultrastructural architecture of liver tissue taken from irradiated animals *in extremis* compared with that of survivors and fed and starved unirradiated controls showed moderate to marked dilatation of the endoplasmic reticulum, increased Golgi activity, and rounding of the mitochondria with a decrease in numbers of mitochondrial granules. These alterations, together with other differences noted, were correlated with the increased plasma concentration of protein-bound neutral hexoses uniformly found in animals which succumbed to radiation injury.

Acute Viral Hepatitis

9114 PREVALENCE OF SERUM-HEPATITIS-RELATED ANTIGEN (SH) IN DIFFERENT GEOGRAPHIC REGIONS. *(E.)* Prince, A. M. (New York Blood Ctr., New York). *Amer J Trop Med Hyg* 19(5):872-879, 1970.

The prevalence of serum-hepatitis related antigen was evaluated in serum of 12,535 persons in New York City, Africa, Central and South America, India, and Pakistan. The serum-hepatitis antigen was 10-100 times more prevalent in clinically well persons from tropical populations (4.3%) than in volunteer blood donors in New York City (0.1%). An exceptionally high frequency of serum-hepatitis antigen positive persons were observed in the Cashinahua Indians of Peru. Nine of 10 positives were under 20 years of age (31.7% of population tested). With the exception of the Cashinahua Indians, no correlation between a decline in frequency of serum containing antigen and increasing age was seen. Since the known mechanisms of transmission of serum hepatitis rarely occur in the tropics or are not more prevalent in the tropics than in temperate regions, transmission of the virus by arthropods may be an important mechanism.

9115 HEPATITIS-ASSOCIATED ANTIGEN IN BLOOD DONOR POPULATIONS: RELATIONSHIP TO POST-TRANSFUSION HEPATITIS. *(E.)* Taswell, H. F. (Mayo Clin., Rochester, Minn.), R. Shorter, T. K. Poncelet and N. G. Maxwell. *JAMA* 214(1):142-144, 1970.

Blood donor serum samples (13,049) from five medical centers were studied for the presence of hepatitis-associated antigen. Of the 8,816 consecutive serum samples from normal blood donors at the Mayo Clinic, 5 (0.057%) showed the presence of hepatitis-associated antigen, and of the 4,233 serum samples from normal blood donors at other institutions, 21 (0.49%) were positive for the hepatitis antigen. The incidences varied, depending on geographical location, from 0.057% to 1.47% and among the 92 implicated donors (ones whose blood was transfused in a 1-, 2-, 3-unit transfusion to a patient who subsequently developed hepatitis within 15-180 days), the median interval between donation of the implicated unit and subsequent blood sample collection from the implicated donor was 8 months (range, 1-84 months); for the hepatitis-associated antigen-positive and negative donors, the median intervals were 6.0 (range, 0-55) and 9.0 (range, 1-84), months, resp. The mean incubation period of hepatitis occurring in affected recipients was 62 days (63 days in patients receiving blood from positive donors and 61 days in patients receiving blood from negative donors). Increased immunoglobulin levels were observed in 15 of the implicated donors; however, only 4 of this group were positive. With more abundant antibody supply becoming readily available, routine screening of all blood donors with an agar-gel diffusion test seemingly would eliminate at least 32% of hepatitis carriers with a mean loss of 0.2% (probable maximum of 1.5%) of the total donor population.

Cirrhosis

9150 FAMILIAL CIRRHOSIS WITH AUTOIMMUNE FEATURES AND RAISED IMMUNOGLOBULIN LEVELS. *(E.)* Joske, R. A. (Dept. Med., U. Western Australia, Perth) and B. H. Laurence. *Gastroenterology* 58(4): 546-552, 1970.

A kindred is described in which 5 members had chronic liver disease (cirrhosis) with abnormal immunological findings and 8 others had abnormal immunological findings without liver diseases. These figures are statistically significant especially as the kinship includes children and young adults in whom the incidence of autoimmune reactions was low in the normal population. Results are attributed to a familial mechanism, and possibly genetic since marriage partners examined were normal, the family was scattered, and no environmental hepatotoxins were identified. Raised immunoglobulin levels were both more frequent and appeared at an earlier age than liver disease in this kindred. The two youngest members of generation II and 3 or 4 investigated in generation III had increased immunoglobulin values without liver disease. The immunoglobulin components affected were IgG and IgA and these were shown to be effective antibodies. The only autoimmune disease of the kindred was cirrhosis. The genetic mechanism is unknown, but high incidence of abnormal findings in this kindred suggests a dominant inheritance, possibly at the level of immunoglobulin control.

9151 PRIMARY CARCINOMA OF THE LIVER COMPLICATING CIRRHOSIS. *(E.)* Oomen, H. A. P. C. (Path. Anat. Lab., U. Amsterdam, Netherlands) and H. Kluck. *Arch Chir Neerland* 22(3):173-182, 1970.

In a review of all cases of liver pathology encountered in 6,572 autopsies (Amsterdam) from 1959-1969, 147 cases could be classified as cirrhosis (65 patients with cirrhosis unexpected and 82 patients with cirrhosis suspected or expected). Twenty cases of this group also had liver carcinoma (12 male and 8 female), with 19 of 20 being European. In the majority of cases (103) clinical data provided no clues to the etiology of cirrhosis, but the disease was attributed to abuse of alcohol in 18 patients and to sequelae of infectious hepatitis in 11. In 19 of 20 patients a pathognomonic macroscopic appearance of the tumor occurred. Malignant nodules differed from cirrhotic nodules in their irregular outline, size and color. This aspect of malignancy was easily recognized by inspection of the liver surface during abdominal operations. The possibility of primary liver carcinoma is recommended when selecting cirrhotic patients for surgical procedures and in the postoperative control.

9152 HISTOCHEMICAL DETECTION OF FIBRINOLYTIC ACTIVITY IN LIVER BIOPSIES. *(Ger.)* Denk, H. (Med. U. Clin., Vienna, Austria), H. Schnack and E. Deutsch. *Acta Hepatosplen* 17(4):221-228, 1970.

The presence of fibrinolytic activity was investigated (Todd's histochemical technique) in liver biopsies from 43 patients with liver disease, 23 of whom had cirrhosis. Definite fibrinolytic activity located in the connective tissue and on the boundaries between parenchymal and connective tissue was observed in 17 cirrhotic patients. The most severe fibrinolysis occurring at endothelial cell and capillary levels was observed in progressive cirrhosis with parenchymal necrosis and dim boundaries of the parenchymal remainder. Minor fibrinolysis confined only to endothelial cells of larger blood vessels in the periportal region was found in 9 biopsies. No fibrinolytic activity was noticed in 17 patients, 2 of whom had inactive cirrhosis, 1 had interstitial hepatitis and 1 patient had liver necrosis produced by CCl_4 poisoning. Clotting alterations characteristic in patients with liver cirrhosis may be due to local fibrinolytic processes.

9153 CIRRHOSIS AND DIABETES: V. SERUM HUMAN GROWTH HORMONE LEVELS IN LAENNEC'S CIRRHOSIS. *(E.)* Conn, H. O. (VA Hosp., West Haven, Conn.) and W. H. Daughaday. *J Lab Clin Med* 76(4): 678-688, 1970.

The relation between diabetes and cirrhosis and elevated serum growth hormone levels was investigated in 18 patients with Laennec's cirrhosis, including 3 studied before and after portacaval anastomosis. Fasting growth hormone levels were elevated in 14 of the 18 patients, and the cirrhosis was more advanced and usually associated with portal hypertension in these patients. Although the mean growth hormone concentration decreased after oral glucose, some patients exhibited paradoxical increments and, in others, growth hormone levels were not suppressed; i.v. glucose was even less effective in suppressing growth hormone levels. Sustained hypersomatotropism could contribute to carbohydrate intolerance in cirrhotic patients and to overt diabetes in those with genetic susceptibility to diabetes.

LIVER AND BILIARY TRACT

Gallbladder and Biliary Tract Diseases

9170 FECAL FATTY ACID PATTERNS IN THE NEONATE. *(E.)* Stevens, J. F. (King's Coll. Hosp., London, England). *J Med Lab Technol* 27(3):327-331, 1970.

Fatty acid composition of feces in the neonate (1 week after birth) was determined by gas chromatography of the methyl esters and compared with the fatty acid composition of the human or bovine milk given to healthy and jaundiced babies. Breast milk contained slightly lower proportions (1-3%) of the saturated fatty acids (C:14 through C:18) and higher proportions (2-7%) of the unsaturated fatty acids (C:16:1, C:18:1, and C:18:2), but samples of feces from breast-fed and bottle-fed babies showed insignificant differences. Feces from babies with obstructive jaundice contained a greatly increased amount of oleic acid (64.4%) compared to feces from healthy babies (47.7%) and decreased amounts of myristic (2.4%), palmitic (13.0%), and stearic (3.4%) compared to feces from healthy babies (4.8%, 24.4%, and 11.9%, resp.).

GENERAL

200 LATE GASTROINTESTINAL COMPLICATIONS IN PATIENTS IRRADIATED FOR CANCER OF THE ERVIX. *(E.)* Ho Yuen, B. (Vancouver Gen. Hosp., itish Columbia, Canada) and D. A. Boyes. *Amer urg* 36(10):642-645, 1970.

venty of 972 instances of cancer of the cervix ges I to IV treated in the period 1954 to 1964 usive at the British Columbia Cancer Institute associated with major gastrointestinal complications noticed approximately 20 months after treatent. In seven of the 20 (or 35%), bowel injury as considered to be due to irradiation in the absence of recurrent cancer. In 12 of the 20 (or 60%) ecurrent cancer complicating the gastrointestinal esion was present; data were insufficient to be ertain of recurrence in 1 case. Possible contriutory factors causing the gastrointestinal lesion were found in 13 (or 65%); the exact significance of these factors is unknown because the same factors in instances without bowel complications were not assessed.

9201 INDICATOR DILUTION STUDIES IN THE SMALL BOWEL OF PATIENTS WITH CHOLERA DIARRHEA: I. JEJUNAL FLOW - TRANSIT TIME - VOLUME RELATIONSHIPS. *(E.)* Brigham, K. L. (Vanderbilt U. Sch. Med., Nashville, Tenn.), J. G. Banwell, N. F. Pierce, R. C. Mitra, D. S. Fedson and A. Mondal. *Johns Hopkins Med J* 127(2):97-106, 1970.

Flow, mean transit time, and mean transit time volume and their relationships were studied in the jejunum of a patient during an attack of acute cholera and during convalescence using indicator dilution techniques. In acute cholera as the rate of infusion increased from 0 ml/min to 30 ml/min, the mean flow rate increased (3.25 to 17.60 ml/min), mean transit time decreased (12.40 to 7.69 min), and mean transit time volume increased (32.77 to 135.55 ml), and in convalescence as the infusion rate increased from 5 ml/min to 30 ml/min, the mean flow rate increased (6.17 to 22.30 ml/min), mean transit time decreased (8.17 to 7.61 min), and mean transit time volume increased (47.67 to 176.17 ml). Mean transit time and calculated flow rate in a 30 cm jejunal segment showed a weak correlation in the acute studies (r = -0.78) but not in the convalescent period, while segment volumes and calculated flows correlated well in both acute (r = 0.950) and convalescent (r = 0.997) studies. Net fluxes of water, sodium, potassium, chloride, and bicarbonate in the 30 cm study segment were all in the direction of the bowel lumen in both studies indicating that the abnormality of jejunal fluid transport persists into the clinical recovery period.

9259 ANTHELMINTIC ACTIVITY OF PYRANTEL PAMOATE. *(E.)* Desowitz, R. S. (Sch. Med., U. Hawaii, Honolulu), T. Bell, J. Williams, R. Cardines and M. Tamarua. *Amer J Trop Med Hyg* 19(5):775-778, 1970.

The anthelmintic activity of pyrantel pamoate was investigated in 62 children infected with *Ascaris Lumbricoides*. A single dose (5 mg/pound) resulted in a cure in 53 cases by the criterion that no eggs were found in the $ZnSO_4$-concentrated stools; in the remaining positive cases, egg count was significantly reduced. In a second group of patients, a 2-day regimen (5 mg/pound daily) cured 37 of 38 *Ascaris*-infected children. A group of 56 patients (53 children and 3 adults) 43 with *N. americanus* infection received 5 mg of pyrantel suspension for 3 consecutive days, with 36 patients showing complete cure in 1 week. Side effects in 31 of 156 patients receiving pyrantel pamoate were chiefly low-grade abdominal cramp during expulsion of ascarids. No abnormal changes in urinalysis, SGOT, or the serum bilirubin levels after single- or tripple-dose regimens was observed. The compound showed no activity against strongyloidiasis, balantidiasis, or giardiasis.

9260 CLINICAL EVALUATION OF METRONIDAZOLE IN HEPATIC AMEBIASIS. *(E.)* Antani, J. (Med. Coll. Gulbarga, Mysore, India) and H. V. Srinivas. *Amer J Trop Med Hyg* 19(5):762-766, 1970.

The efficacy of metronidazole (Flagyl) in *Entamoeba histolytica* infection was tested in 25 hospitalized patients (aged 16-68 years) with secondary hepatomegaly; when metronidazole (200 mg, t.i.d. for 7 days) was administered to these patients, malaise, fever, and abdominal pain were relieved during the first 3 days of therapy and disappeared by the 6th day in most cases. Flatulence (a typical symptom) was markedly reduced in 15 of 25 patients by the end of the first week, and 5 more patients were relieved after 2 weeks. Hepatic tenderness disappeared in all patients after 3 days, and hepatomegaly regressed rapidly in all patients. At the end of 3 weeks, parasitologic cure was found in 22 of 25 patients which lasted for an additional 12 weeks after the beginning of treatment; cysts persisted in 3 patients. Side effects were transitory, and the drug was well tolerated.

9261 HYDATID DISEASE IN THE CENTRAL VALLEY OF CALIFORNIA: TRANSMISSION OF INFECTION AMONG DOGS, SHEEP, AND MAN IN KERN COUNTY. *(E.)* Schantz, P. M. (Dept. Epidem., U. California, Davis), R. P. Clerou, I. K. M. Liu and C. W. Schwabe. *Amer J Trop Med Hyg* 19(5):823-830, 1970.

A 49-year-old sheep rancher in Kern Caounty, California who died following surgery for removal of two fertile, unilocular hydatid cysts from his left lung was described. When the ranch (with 2,500 to 3,000 sheep) was investigated for *Echinococcus granulosus*, one dead sheep with a hydatic cyst of the liver and 10/11 infected sheep dogs were found. Dogs apparently ate sheep carcasses and ingested cysts with scolices. Of 74 relatives, employees and associates of the dead rancher, skin tests showed that 8 had wheals of 1 cm^2 or greater; of 7 of these persons tested by indirect hemagglutination, 2 showed possible *Echinococcus* infection.

9262 THIABENDAZOLE TREATMENT OF ASCARIASIS IN IRAN. *(Fr.)* Sanati, A. (no affil), E. Ghadirian and M. Siadate. *Med Trop* 30(4):521-525, 1970.

DESCRIPTION OF INDEXES

SUBJECT and AUTHOR INDEXES for Gastroenterology Abstracts and Citations, Volume 5, are produced from on-line computer print-out of key-punched cards.

The SUBJECT INDEX is based on a hierarchial system of classification in which *major index terms* are modified by one or more *key word descriptors*. The *key word descriptors* are listed in decreasing order of importance and describe the content of the abstract or citation. In addition, in this indexing system, some *key word descriptors* will also be used as *major index terms*, thus providing in-depth indexing of each document. An abstract or citation number, in brackets, will be found after the *key word descriptors*. Abstracts will be identified by an asterisk outside of the brackets.

An illustrative example of this indexing system follows:

INTESTINE, LARGE

Colon, Carcinoma, Radiological Detection, Rectum (0188)*

COLON

Cancer, Polyps, Radiological Detection (0188)*

RECTUM

Cancer, Polyps, Precancerous (0188)*

CANCER

Large Intestine, Detection, Radiology (0188)*

DIAGNOSIS

Radiology, Cancer, Large Intestine (0188)*

umbers followed by an asterisk refer to abstracts in the text. Other numbers refer to citations.

SUBJECT INDEX

- ABDOMEN
  - ACUTE, GASTROINTESTINAL TRACT PERFORATIONS, MORTALITY RATE, ANATOMOPATHOLOGY (9241)
  - ACUTE, LEUCOCYTOSIS, ACUTE HEMORRHAGE, METABOLIC DISORDERS (9239)
  - ACUTE, RADIOLOGY, ABDOMINAL VASCULATORY DISORDERS, ANGIOGRAPHY (8763)
  - ACUTE, SYMPTOMATOLOGY, ETIOLOGY, PAIN (9238)
  - ACUTE, TRAUMA, IATROGENIC LESIONS, EMERGENCY MEASURES (9242)
  - EMBRYONIC DEVELOPMENT, OMPHALOCELE, GASTROSCHISIS (8846)
  - FRONT WALL, PROJECTION OF SMALL INTESTINE, JAPAN (8530)
  - SURGERY, PREMATURE CORRECTIVE INTERVENTION (9246)
- ABSORPTION
  - CALCIUM, VITAMIN D, RICKETS, RAT (8555)*
  - CARBOHYDRATES, BLOOD CALCIUM LEVELS, MAN (8563)
  - COLON, VITAMIN B, FLORA (8564)
  - GASTROINTESTINAL TRACT, CEPHALEXIN, ULCER (8835)
  - INTESTINAL, SUGAR, SODIUM, DIABETIC RATS (8554)*
  - INTESTINE, CALCIUM AND PHOSPHORUS, SIMULTANEOUS INTRAVENOUS INFUSION, PIG (8571)
  - INTRAABDOMINAL, EVANS BLUE LABELED PROTEIN, DOG (8561)
  - IRON, ACCUMULATION IN DUODENAL MUCOSA, THALASSEMIA, CHILDREN (8752)
  - LIPIDS, DUODENAL EPITHELIUM, EXPOSURE TO CE144, RAT (8569)
  - SMALL INTESTINE, DRUG COATING, PROTECTION AGAINST GASTRIC JUICE (8567)
- ACETYLCHOLINE
  - CONTROL, GLUCONEOGENESIS, PERFUSED LIVER, RAT (8665)
- ADRENALECTOMY
  - HISTOLOGY, ENZYME, AUTORADIOGRAPHY (8598)*
- ALCOHOL
  - LIVER INJURY, GLUTATHIONE, LIPID PEROXIDATION (8638)*
  - LIVER METABOLISM, GLUCOSE, NADH, AMINOLEVULINATE SYNTHETASE (8628)*
- ALCOHOLISM
  - CHRONIC, ALCOHOL, METABOLISM, LIVER STEATOSIS, CIRRHOSIS (9154)
  - LIVER DAMAGE, ELECTRON MICROSCOPY, LIVER FUNCTION (8653)
  - LIVER STEATOSIS, DIET, PATHOGENESIS (9110)
  - LIVER STEATOSIS, PATHOGENESIS, LIPID METABOLISM (9094)
  - PANCREATITIS, PARASITES, PANCREATIC CARCINOMA (9036)
- ALLOGRAFT
  - PANCREAS, NATURAL DEVELOPMENT, FUNCTIONAL AND MORPHOLOGICAL ALTERATIONS (9007)
- AMEBIASIS
  - LIVER, DIAGNOSIS, SAIGON (9263)
  - LIVER, METRONIDAZOLE (9260)*
- AMINO ACID
  - LIVER POOLS, HYPERGLYCEMIA, GLUCAGON, HYDROCORTISONE (8627)*
- AMMONIA
  - BLOOD, LIVER CIRRHOSIS, ANTIBIOTIC TREATMENT (9165)
  - BLOOD, LIVER PATHOLOGY, DIAGNOSIS (8724)
- AMYLASE
  - ALPHA, METABOLISM, URINE CONTENT, PANCREATIC SECRETION (8600)
- ANASTOMOSIS
  - GASTRODUODENAL, GASTRECTOMY, PEPTIC ULCER (8893)
- ANATOMOPATHOLOGY
  - CHRONIC PANCREATITIS, TRYPTIC NECROSIS PATHOGENESIS (9025)
  - CONGENITAL ESOPHAGEAL STENOSES, SURGERY (8810)
  - GASTRIC TERATOMA, SYMPTOMATOLOGY, NEWBORN (8847)
  - POSTHEPATITIC SYNDROMES, CLASSIFICATION, AGGRESSIVE AND PERSISTENT CHRONIC HEPATITIS (9146)
  - VESICOINTESTINAL FISSURE, SURGERY, CLINICAL VARIETIES (8978)
- ANEMIA
  - CROHN'S DISEASE, REGIONAL ILEOCOLITIS, SURGICAL TREATMENT (8927)
- ANESTHESIA
  - HALOTHANE, LIVER FUNCTION, SURGERY (9113)
- ANGIOGRAPHY
  - PANCREATIC CARCINOMA, RETROSPECTIVE, PREOPERATIVE, DIAGNOSIS (8705)*
- ANTHELMINTIC
  - PYRANTEL PAMOATE, ASCARIASIS, CHILDREN (9259)*
- ANTIBIOTIC
  - ACTINOMYCIN D, INTESTINAL EPITHELIUM, RAT (8690)*
  - E.COLI RESISTENCE, ENTERITIS, CHARACTERISTIC H-ANTIGEN (8721)
  - INTESTINAL MICROFLORA, COLON, ILEUM (9224)
  - NEOMYCIN, INFECTIOUS DIARRHEA, CHILDREN (9202)
- ANTIBODY
  - ABO(H)-BLOOD GROUP, GASTROINTESTINAL ANTIGENS, ULCERATIVE COLITIS (8995)
  - ACID CELL, GASTRIC MUCOSA, CHRONIC GASTRITIS (8844)
  - GASTRIN TETRAPEPTIDE, SERUM PROTEIN CARRIERS (8506)*
- ANTIGEN
  - AUSTRALIA, BLOOD DONORS, VIRAL HEPATITIS (9116)
  - AUSTRALIA, CHILE, INCIDENCE, VIRAL HEPATITIS (9119)
  - AUSTRALIA, HEMODIALYSIS CENTER, VIRAL HEPATITIS (9118)
  - AUSTRALIA, INCIDENCE, LIVER DISEASES, VIRAL HEPATITIS (9141)
  - AUSTRALIA, VIRAL HEPATITIS, BLOOD TRANSFUSION, PROPHYLAXIS (9125)
  - AUSTRALIA, VIRAL HEPATITIS, INCIDENCE, SICILY (9138)
  - AUSTRALIA, VIRAL HEPATITIS, LIVER

DISEASES, SYSTEMIC DISEASES (9139)
AUSTRALIA, VIRAL HEPATITIS, LIVER DISEASES, TRANSFUSION PATIENTS (9119)
AUSTRALIA, VIRAL HEPATITIS, PERIARTERITIS NODOSA, LIVER HISTOPATHOLOGY (9121)
E.COLI, CULTIVATION, IMMUNOFLUORESCENCE (8720)
SH SERUM HEPATITIS, PREVALENCE (9114)*
SPECIFIC FEATURES, FASCIOLA HEPATICA, LIVER ALTERATIONS (8539)
STIMULATION OF LYMPHOCYTES, IN VITRO, LIVER, CIRRHOSIS (9065)

ANTRUM
PYLORUS, HETEROTOPIC PANCREAS, BLEEDING SYNDROME (9005)

ANUS
ANORECTAL VENEREAL DISEASES, PROCTOLOGY, DETECTION (8982)
FISTULA, ANATOMOPATHOLOGY, TREATMENT (8943)
SYPHILIS, PRIMARY AND SECONDARY, DIAGNOSIS (8984)

APPENDECTOMY
URETHRAL RUPTURE, SURGICAL MANAGEMENT (8967)

APPENDICITIS
PERITONITIS CHRONICA FIBROSA ENCAPSULANS, ILEUS, DIAGNOSIS (8764)

ARTERIOGRAPHY
SMALL INTESTINE, TUMORS, HISTOLOGY (8907)
ULCERATIVE RECTOCOLITIS, LOWER MESENTERIC ARTERIO-VENOUS FISTULA SURGERY (8996)

ARTERY
PANCREATICODUODENAL, SPONTANEOUS RUPTURE, DIAGNOSIS, SURGERY (9222)

ASCARIASIS
LUMBRICOIDES, PYRANTEL PAMOATE, CHILDREN (9259)*
THIABENDAZOLE TREATMENT, IRAN (9262)

ATRESIA
ANUS, RECTUM, DIAGNOSIS (8761)
COLON, DIAGNOSIS, TREATMENT (8979)
ESOPHAGEAL, ASSOCIATED MALFORMATIONS, SURGERY, PROGNOSIS (8803)
ESOPHAGEAL, MEMBRANOUS STENOSIS, THERAPY, ANATOMOPATHOLOGY (8801)
ESOPHAGEAL, VARICES, REPLACEMENT, COLON (8809)
ESOPHAGUS, SURGERY, INFANT (8794)
ESOPHAGUS, SURGERY, MORTALITY (8802)
ESOPHAGUS, TRANSVERSE COLON TRANSPLANT, ESOPHAGOSTOMY (8812)

BACTERIA
CLOSTRIDIUM PERFRINGENS, FLORA, NORMAL INTESTINE (8695)*
SALMONELLA THOMPSON, EPIDEMIOLOGY (9245)

BACTERIAL DISEASE
SALMONELLOSIS, BACTRIM THERAPY, TYPHOID FEVER (9237)
SALMONELLOSIS, DIAGNOSIS, CHICKEN (8769)
SALMONELLOSIS, FOOD POISONING, HYGIENE (9236)
SALMONELLOSIS, PARATYPHOID FEVER, CARRIERS, SCHLESWIG-HOLSTEIN (9247)
SHIGELLA SONNEI INFECTION, SULFONAMIDE THERAPY, ADULTS (9248)

BILE
GALLBLADDER, COMMON BILE DUCT, ALKALINE PHOSPHATASE (9187)
HEMOBILIA, FALSE ANEURYSM, RIGHT HEPATIC ARTERY (9184)
VISCOSITY, GALLBLADDER CONTRACTION, FLOATING BILE STONES (9189)

BILE ACID
COMPOSITION, ESTRADIOL, CHOLESTEROL, THYROXINE (8632)*

BILE DUCT
DILATATION, PSEUDOCYST, PATHOGENESIS (9191)
INTRAHEPATIC, PRIMARY STENOSIS, CHOLANGIOGRAPHY, ETIOLOGY (9176)
OBSTRUCTION, HETEROTOPIC PANCREAS, DUODENAL WALL (9178)

BILE PIGMENT
UROBILIN, UROBILINOGEN, STERCOBILIN, CLOSTRIDRIA (8699)

BILE SALT
ENTEROHEPATIC CIRCULATION, INTESTINAL ABSORPTION, BILE ACID, BIOSYNTHESIS (8570)
METABOLISM, INTESTINAL LIPID ABSORPTION, BLIND LOOP SYNDROME (8562)

BILHARZIASIS
INTESTINE, DETECTION, CHILDREN (9279)
WOODY REGIONS, EPIDEMIOLOGY (9278)

BILIARY TRACT
CHOLANGITIS, ACUTE SUPPURATIVE, AMPULLARY FIBROSIS (9172)
COMMON BILE DUCT, REPLACEMENT, SILICONE RUBBER (9171)
COMMON DUCT, NONOBSTRUCTIVE DILATATION, STONES (9185)
DISEASE, CHRONIC PANCREATITIS, ALCOHOLISM (9016)
DISEASE, DIAGNOSIS, CHOLANGIOGRAPHY (8746)
HEMOBILIA, FALSE ANEURYSM, HEPATIC ARTERY (9184)
PRIMARY MALIGNANT TUMOR, OBSTRUCTIVE JAUNDICE, DIAGNOSIS (9179)
SURGERY, MORTALITY RATE, PANCREATIC INVOLVEMENT (9181)
SURGERY, OPERATIVE RADIOMANOMETRICAL FLUX MEASUREMENT, OPERATIVE CHOLANGIOGRAPHY (8752)

BILIRUBIN
GLUCURONYL TRANSFERASE, LIVER, ETHANOL, PARTIAL HEPATECTOMY, RAT (8650)
HYPERBILIRUBINEMIA, PHENOBARBITAL, ENZYME INDUCTION (8679)

BIOPSY
INTESTINE, TUBERCULOSIS, CHILD (9249)
MENGHINI'S, LIVER, TECHNICAL IMPROVEMENTS, CHILDREN, INFANTS (8778)

BLEEDING
GASTRIC AND DUODENAL ULCER, INCIDENCE, CHILDREN (8890)
HEMORRHOID, LIGATURE, NODULAR HEMORRHOIDS (8959)

BLOOD
DONORS, AUSTRALIA ANTIGEN, INCIDENCE (9116)
TRANSFUSION, UPPER INTESTINAL TRACT HEMORRHAGE, TREATMENT (9231)

BLOOD VESSEL
FUNCTIONAL MESENTERIC OCCLUSION, NECROSIS OF COLON, SURGERY (9251)

  - HEPATIC AND SUPERIOR MESENTERIC ARTERIES, OCCLUSION, LIVER, BLOOD FLOW (9255)
  - PANCREATICODUODENAL ARTERY, SPONTANEOUS RUPTURE, DIAGNOSIS (9222)
  - PERIPHERAL ARTERITIS, CHRONIC PANCREATITIS, ETIOLOGY (9037)
  - PORTAL VENOUS SYSTEM, PNEUMATOSIS, PROGNOSIS (9214)
  - VENOUS OCCLUSION, LIVER, CIRRHOSIS, ETIOLOGY (9063)
- BONE MARROW
  - FUNCTION, LEUCOCYTIC RESISTANCE, CHRONIC LIVER DISEASES (9156)
  - PROLIFERATION, VIRAL HEPATITIS, CHILDREN (9130)
- BOWEL
  - DISEASE, INFLAMMATORY ENTERITIS, MAGNESIUM DEFICIENCY, ULCERATIVE COLITIS (8921)*
- CALCIFICATION
  - CARCINOMA, PANCREAS, ALCOHOLISM, ENZYME TESTS (9015)*
- CANCER
  - CERVIX, IRRADIATION, GASTROINTESTINAL LESION (9200)*
  - LIVER DETOXIFICATION FUNCTION, GLUCURONIDE FORMATION, CIRRHOSIS (9040)*
  - RECTUM, SURGERY, TECHNIQUE (8970)
- CARBOHYDRATE
  - ABSORPTION, BLOOD CALCIUM LEVEL, MAN (8563)
  - OVERLOAD, LIVER, GLYCOGENOSIS, GALACTOSEMIA, FRUCTOSEMIA (9070)
  - PROTEIN BOUND, HEXOSES, LIVER DAMAGE (9093)*
- CARCINOGEN
  - B-PROPIOLACTONE, HAPATOMA, SUCKLING MICE (8637)*
  - N-HYDROXY-2-FLUORENYLACETAMIDE, ADDUCT, LIVER PROTEIN (8671)
  - O-TOLUIDINE, HEMATEST, FECAL BLOOD TEST, AMIDOPYRINE (8704)*
  - 2-ACETYLAMINOFLUORENE, LIVER ULTRASTRUCTURE (8639)*
- CARCINOGENESIS
  - LIVER, ADRENALECTOMY, MOUSE (8678)
  - LIVER, PRECANCEROUS STAGE, MORPHOLOGY (8683)
- CARCINOMA
  - ADENO-, PRIMARY, JEJUNUM (8900)
  - BILIARY TRACT, WHIPPLE RESECTION (9193)
  - COLON, EXTENSIVE, SURGERY (8971)
  - DIAGNOSIS, LAPAROTOMY, BENIGN LESION, CYTOLOGY (8709)*
  - ESOPHAGUS, HEMATOLOGY, SURVIVAL TIME, THERAPY, RADIATION (8791)*
  - LIVER SARCOMA, THOROTRAST (9076)
  - PRIMARY, LIVER, CIRRHOSIS, SURGERY (9151)*
- CELIAC AXIS
  - STENOSIS, DUODENOPANCREATECTOMY (9227)
  - STENOSIS, LIGAMENT CONSTRICTION, AORTOGRAPHY, ANATOMOPATHOLOGY (9225)
- CELIAC DISEASE
  - DEPEPTIDASE, DISACCHARIDASE, SMALL INTESTINE (8929)*
- CHOLANGIOGRAPHY
  - BILIARY TRACT DISEASE, DIAGNOSIS (8746)
- CHOLANGITIS
  - ACUTE SUPPURATIVE, AMPULLARY FIBROSIS (9172)
  - SCLEROSING, INTRAHEPATIC BILIARY CANALICULI, CHRONIC JAUNDICE, CHOLANGIOGRAPHY (8605)
- CHOLECYSTITIS
  - ACUTE, EMERGENCY CHOLECYSTECTOMY, RADIOLOGY, MORTALITY (9183)
  - NONCALCULOUS, ACUTE, POST-SURGICAL, TRAUMA (9180)
- CHOLEDOCHOLITHIASIS
  - GASTRECTOMY, DUODENAL ULCER, BILLROTH II (9199)
- CHOLEDOCHOTOMY
  - DIAPHRAGM, THORACIC FISTULA, RADIOLOGY (9186)
- CHOLELITHIASIS
  - ACUTE PANCREATITIS, EARLY STAGE, SURGERY (9029)
  - BILE CHOLESTEROL, GALLSTONE FORMATION, LIPID METABOLISM, CIRRHOSIS (8607)*
  - BILIARY PERITONITIS, PANCREATICOBILIARY REFLUX, BILIARY HYPERTENSION (9197)
  - FLOATING BILE STONES, BILE VISCOSITY, GALLBLADDER CONTRACTION (9189)
  - OPERATIVE CHOLANGIOGRAPHY, INTRAHEPATIC, BILE DUCT STENOSIS, CHOLANGITIS (8783)
  - SOLITARY OCCLUSIVE STONE, GALLBLADDER NECK, RADIOGRAPHY (9190)
  - SURGERY, EXTRAHEPATIC BILE DUCT, MORTALITY RATE (9182)
  - SYMPTOMLESS GALLSTONE, OPERATIVE RADIOLOGY, OPERATIVE MANOMETRY (9198)
- CHOLERA
  - ACUTE, CONVALESCENCE, INDICATOR DILUTION STUDY (9201)*
  - SMALL BOWEL, INDICATOR DILUTION STUDY (8928)*
- CHOLERESIS
  - INDAZOLE DERIVATIVES, PHARMACODYNAMICS, RAT (8675)
- CHOLERETIC AGENT
  - CHOLECYSTOKININ, GASTRIN II, CERULEIN (8619)*
- CHOLESTASIS
  - EXTRAHEPATIC, LIPIDS, LIVER, SERUM, JAUNDICE (9081)
- CHOLESTEROL
  - BILE, CHOLIC ACID, METABOLISM (8610)*
  - BIOSYNTHESIS, 4-ALPHA-METHYL STEROL, LIVER MICROSOMAL OXIDATION (8654)
  - BIOSYNTHESIS, INHIBITOR (8644)
  - BIOSYNTHESIS, OXIDATION OF 4, 4-DIMETHYL STEROL, LIVER MICROSOME (8649)
  - METABOLISM, ABSORPTION (8565)
- CIRCULATION
  - HEPATIC ARTERY, RUPTURED ANEURYSM (9209)
  - LIVER, PARTIAL HEPATECTOMY, VASCULAR ANATOMY (8696)*
  - LIVER, XENON 133 (8745)
  - SPINAL CORD, HEATING, COOLING, INTESTINAL (8698)
- CIRRHOSIS
  - ALCOHOLIC, RENAL MEDULLAR NECROSIS, PATHOLOGY (9168)
  - ANICTERIC, LIVER, SULFOBROMOPHTHALEIN,

  - CHOLINESTERASE, TESTS (9159)
  - FAMILIAL, IMMUNOGLOBULIN, AUTOIMMUNE FEATURES (9150)*
  - HEPATECTOMY, PARTIAL, HUMAN (9161)
  - LAENNEC'S, GROWTH HORMONE, DIABETES (9153)*
  - LAENNEC'S LIVER, LIPID METABOLISM, GALLSTONE FORMATION (8607)*
  - LIVER, ASCITES, MANAGEMENT (8647)
  - LIVER, CHRONIC HEPATITIS, SERUM COMPLEMENT (9044)
  - LIVER, FIBRINOLYTIC ACTIVITY, CLOTTING DISORDERS (9152)*
  - LIVER, MALLORY BODIES, FATTY INFILTRATION (9042)*
  - LIVER, PITUITARY AND ADRENAL FUNCTION, PLASMA CORTISOL BREAKDOWN (9160)
  - LIVER, PORTACAVAL SHUNT, NECROSIS (9157)
  - LIVER, PROGNOSIS, THERAPY (9163)
  - LIVER, RIGHT-SIDED HYDROTHORAX, PATHOGENESIS (9167)
  - LIVER SIZE, FUNCTION, BLOOD FLOW (9164)
  - PRIMARY CARCINOMA, SURGERY (9151)*
  - SELENIUM 75-METHIONINE, DIAGNOSIS, LIVER (8706)*

- COLITIS
  - CONSTIPATION, BISMUTH SUBNITRATE, KARAYA GUM (8946)
  - GASTROENTERITIS, DIROMO, BACTERICIDE EFFECT (9203)
  - ULCERATIVE, AZULFIDINE, METABOLISM, EXCRETION (8557)*
- COLON
  - ABSORPTION, VITAMIN B, FLORA (8564)
  - ATRESIA, DIAGNOSIS, TREATMENT (8979)
  - BILE DUCT, FISTULA, ANATOMOPATHOLOGY, PATHOGENESIS (9175)
  - CARCINOMA, SURGERY, EXTENSIVE (8971)
  - CROHN'S DISEASE, ANAL LESIONS, RADIOLOGY (9001)
  - CROHN'S DISEASE, DIAGNOSIS, SYMPTOMATOLOGY (9000)
  - DIVERTICULITIS, PELVIC SEPSIS, SURGERY (8975)
  - DIVERTICULITIS, SIGMOID MYOTOMY, LAPAROTOMY (8973)
  - DIVERTICULOSIS, ABDOMINAL MUSCULATURE DEFICIENCY (8957)
  - DIVERTICULOSIS, ETIOLOGY, EPIDEMIOLOGY (8944)
  - ENDOSCOPY, ENDOPHOTOGRAPHY, NEOPLASTIC LESIONS (8772)
  - EPITHELIUM, CRYPTS, PROLIFERATION KINETICS (8510)*
  - ISCHEMIC, REVERSIBLE, ANGIOGRAPHY (8986)
  - MAN, IN VITRO, TRANSPORT, SODIUM (8548)*
  - MEGA-, TOXIC, ULCERATIVE COLITIS, ILEOSTOMY COLOSTOMY (8999)
  - PARTIAL NECROSIS, MESENTERIC VASCULARY OCCLUSION, SURGERY (9251)
  - PERFORATION, ABDOMINAL TRAUMA, TRAFFIC ACCIDENTS (8945)
  - PERFORATION, SPONTANEOUS, HEMODIALYSIS (8977)
  - POLYPOSIS COLI, FAMILIAL, PREVENTATIVE SURGERY (8968)

EXPERIMENTAL STEATOSIS, CHOLINE, OROTATE, RAT (8682)
EXTRACT WITH B12, E,K, PROTECTIVE EFFECT, LIVER DISEASES, TUBERCULOSIS (9066)
FASTED, ACID-STABLE RIBONUCLEASE (8657)
FASTING, LYSOSOMES, REGRESSION (8620)•
FATTY ACID, NEONATE, OBSTRUCTIVE JAUNDICE (9770)•
FATTY ACID DEFICIENCY, TRIGLYCERIDE RELEASE, PERFUSED (8618)•
FATTY ACID METABOLISM, ALCOHOL, RAT (8633)•
FATTY ACID METABOLISM, COENZYMES, GUINEA PIG (8608)•
FIBRINOLYTIC ACTIVITY, CIRRHOSIS, CLOTTING DISORDERS (9152)•
FIBROSIS, ALCOHOLIC HEAPTITIS, MESENCHYMAL CELL (9057)
FRUCTOSE INTOLERANCE, FIBROSIS, STEATOSIS, BIOPSY, LIVER (9038)•
FUNCTION, ALCOHOLISM, MORPHOLOGICAL ALTERATIONS (8653)
FUNCTION, ALKYLPHOSPHATE INTOXICATION, ANTIDOTE THERAPY, RAT, RABBIT (9108)
FUNCTION, BENZYDAMINE HCL (9058)
FUNCTION, CORTISOL HYPERSECRETION, LIVER GLUCONEOGENESIS, TRANSAMINASES (9046)
FUNCTION, DRUG METABOLISM, ALCOHOL INTERFERENCE (8667)
FUNCTION, HALOTHANE ANESTHESIA, SURGERY (9113)
FUNCTION, HALOTHANE NARCOSIS, SURGERY (9112)
FUNCTION, MESENCHYMAL CLEARANCE, COLLOIDAL IRON (8786)
FUNCTION, PORTACAVAL SHUNT, CIRRHOSIS (9157)
FUNCTION, RIFAMPICIN, BILIRUBIN (9089)
FUNCTION, STEATOSIS, PREGNANCY (9082)
FUNCTION, SULFOBROMOPHTHALEIN CLEARANCE, PREGNANT WOMEN, VIRAL HEPATITIS HISTORY (9142)
FUNCTION, SULFOBROMOPHTHALEIN INTOLERANCE (8788)
FUNCTION, TRANSAMINASES, RIFAMPICIN (9090)
FUNCTION, WILSON'S DISEASE, NEUROLOGICAL LESIONS (9045)
GLUCONEOGENESIS, STIMULATION, HYPOPHYSECTOMY (8672)
GLUCURONYL TRANSFERASE, ETHANOL, SMOOTH, ENDOPLASMIC RETICULUM, PARTIAL HEPATECTOMY, RAT (8650)
GLYCONEOGENESIS, ALPHA-METHYLTRYPTOPHAN, AMINO ACID SPARING (8645)
GRANULOMATOSIS, HISTOPATHOLOGY, CLINICAL FEATURES (9105)
HEMODYNAMICS, OCCLUSION OF HEPATIC AN SUPERIOR MESENTERIC ARTERIES, HEPATIC OUTFLOW BLOCK, DOG (9255)
HEPATECTOMY, 5-FLUOROURACIL, ULTRASTRUCTURE, RNA (8621)•
HEPATECTOMY, TRIGLYCERIDE, ACCUMULATION (8606)•
HEPATITIS, ANTIGEN, BLOOD DONOR, POST-TRANSFUSION (9115)•
HEPATITIS, VIRAL, DRUG, INDIGENOUS (9128)
HEPATOCYTE ULTRASTRUCTURE, 2-ACETYLAMINOFLUORENE (8639)•
HETEROTOPIC TRANSPLANT, ANATOMICAL AN PHYSIOLOGICAL REQUIREMENTS, PIG (9071)
HETEROTOPIC TRANSPLANT INDICATIONS, CHRONIC HEPATIC INSUFFICIENCY, MAN (9072)
HISTOCHEMICAL ALTERATIONS, ENDOCRINE DISORDERS, RAT (8536)
HISTOLOGY, CHRONIC HEPATITIS, ACTIVE AND PERSISTENT, PATHOGENESIS (9148)
HISTOLOGY, EXPERIMENTAL HEPATITIS, ANTILYMPHOCYTE GLOBULIN TREATMENT, MOUSE (9097)
HISTOLOGY, FETAL AND ADULT STAGE, MA (8535)
HISTOLOGY, HEPATITIS, SERUM IMMUNOGLOBULINS (9101)
HISTOPATHOLOGY, BILE DUCT ATRESIA, INFANT (9195)
HISTOPATHOLOGY, INFECTIOUS MONONUCLE SIS, HEPATITIS (9123)
HYDATID CYST, SURGERY, DELAYED RESUL (9132)
INBORN ERRORS OF METABOLISM, GALACTOSEMIA, INFANTS (9047)
INFECTIOUS HEPATITIS, EPIDEMIC, CHILDREN, IMMUNOGLOBULIN (9140)
IODINE COMPOUNDS, TOXICITY, UROGRAPH (8748)
ISOLATED NUCLEI, LYSOSOMAL HYDROLASE RAT (8518)
ISOTOPE CLEARANCE, PORTAL FLOW MEASUREMENT (8733)
KERATAN SULFATES, GM1-GANGLIOSIDOSIS TYPE I, LYSOSOMAL HYDROLASES (9043
KETONE BODIES, TYROSINE ALPHA-KETOGLUTARATE TRANSAMINASE (8664)
KIDNEY, XANTHINE DEHYDROGENASE, STARVATION (8625)•
LAENNEC'S CIRRHOSIS, GROWTH HORMONE, DIABETES (9153)•
LESIONS, ARTERIO-PORTAL FISTULA, SULFOBROMOPHTHALEIN CLEARANCE (908
LESIONS, SCHISTOSOMA JAPONICUM, EGGS (9271)
LIPIDOSIS, WOLMAN'S DISEASE, NECROSI AND FIBROSIS, INTESTINAL MALABSORPTION (9074)
LIPIDS, JAUNDICE, EXTRAHEPATIC CHOLESTASIS (9081)
LIPOMA, CASE REPORT (9077)
MALLORY BODIES, FATTY INFILTRATION, CIRRHOSIS (9042)•
METABOLISM, AMINO ACIDS, HYPERGLYCEMIA, GLUCONEOGENESIS (8627)•
METABOLISM, BARBITURATES, ENZYME

INDUCTION (8673)
METABOLISM, GLUTAMINE, PH EFFECT, ACIDOSIS (8616)•
METALLOTHIONEIN, CADMIUM, SELECTIVE BINDING (8648)
METASTASES, CARCINOID TUMOR, RADIOTHERAPY (9069)
METASTASES, HEPATOGRAPHY WITH LIPIODOL ABDOMINAL TUMORS (8718)
MICROSOMAL MIXED FUNCTION, OXIDASE, D_2O INHIBITION (8623)•
MICROSOME, DRUG METABOLISM, POSTMORTEM (8624)•
MICROSOME, HEME TURNOVER, CYTOCHROME B5 (8661)
MICROSOMES, PROTEIN, CYANIDE BINDING (8525)
MICROSOME, PROTEIN SYNTHESIS, RAT (8656)
MICROSOMES, STEROID, HYDROXYLATION (8613)•
MITOCHONDRIA, CONFORMATION, RAT (8505)•
MITOCHONDRIA, INNER MEMBRANE, PROTEINS (8524)
MITOCHONDRIA, LIPID METABOLISM, RAT (8611)•
MITOCHONDRIA, OXIDATIVE PHOSPHORYLATION, BIOTIN DEFICIENCY, RAT (8676)
MITOCHONDRIA, PIGMENT, CYTOPLASM (9039)•
MITOCHONDRIA, PROTEIN SYNTHESIS, WARFARIN, VITAMIN K (8662)
MITOCHONDRIA, RESPIRATION, HYPOKINESIA RAT (8674)
MORPHOLOGY, GALACTOSAMINE, GIGANTOBLASTIC HEPATITIS, PREGNANT RAT, BABY RAT (9104)
MORPHOLOGY, GASTRIC CARCINOMA, GASTROINTESTINAL TRACT DISEASES (8538)
MORPHOLOGY, 3'-PHOSPHOADENYLYLSULFATE STEROID SULFOTRANSFERASE, MAN (8532)
MUCOPOLYSACCHARIDOSES I AND III, ACID HYDROLASES, SERUM (9078)
NECROSIS, CARBON TETRACHLORIDE POISONING, ENDOXANE (9096)
NEEDLE BIOPSY, TECHNICAL IMPROVEMENTS, CHILDREN, INFANTS (8778)
N-HYDROXY-2-FLUORENYLACETAMIDE, ADDUCT, PROTEIN (8671)
NEOPLASM, HYDATID CYST, RADIOISOTOPIC TECHNIQUE, CLEARANCE TESTS (8758)
ORTHOTOPIC HOMOTRANSPLANT, REJECTION, PIGLET (9092)
ORTHOTOPIC TRANSPLANT, IMMUNOLOGY, ANATOMOPATHOLOGY, DOG (9086)
PARENCHYMAL CELLS, FREE INORGANIC PHOSPHATE, HISTOCHEMISTRY, AUTORADIOGRAPHY, RAT (8521)
PARTIAL HEPATECTOMY, CIRCULATION (8696)•
PATHOLOGY, ANTIGLOBULIN CONSUMPTION TEST, VIRAL HEPATITIS (9050)
LIVER, PATHOLOGY, COENZYME PREPARATION CLINICAL TRIAL (9054)
PATHOLOGY, GAMMA CAMERA, INSPIRATION AND EXPIRATION VIEWS, HEPATIC PLIABILITY (8747)
PATHOLOGY, INFUSION CHOLECYSTOCHOLANGIOGRAPHY, SERUM ENZYMES (8725)
PATHOLOGY, INTRAVENOUS GALACTOSE TOLERANCE TEST, LIVER FUNCTION TESTS (8777)
PATHOLOGY, THOROTRAST, CHRONIC HEPATITIS (9052)
PEROXISOMES, GLYOXALATE METABOLISM (8617)•
PRIMARY CANCER, ANATOMOPATHOLOGY, DIAGNOSIS (9061)
PRIMARY CARCINOMA, HYPERLIPEMIA, ERYTHROCYTOSIS (9051)
PRIMARY CARCINOMA, SPONTANEOUS RUPTURE HEMATOPERITONEUM (9056)
PROTEASE, HISTAMINE, PHENIRAMINE MALEATE (8659)
PROTECTION, ALPHA-ALPHA-DITHIOCAPRONIC ACID CALCIUM SALT, LIPEMIA (9083)
PROTEIN SYNTHESIS, POLYSOMES, FREE AND BOUND (8642)
PUNCTURE BIOPSY, LAPAROSCOPY, PROPHYLAXIS (8782)
RADIATION INJURY, ULTRASTRUCTURE, HEXOSES (9093)•
RAT, ETHANOL, PORPHYRIN, NADH (8628)•
REGENERATING, ALKALINE DEOXYRIBONUCLEASE (8643)
REGENERATION, MITOTIC INDEX, CIRCADIAN RHYTHM, PARTIAL HEPATECTOMY, RAT (8652)
REGENERATION, PARTIAL HEPATECTOMY, ELECTROPHORETIC PROTEIN PATTERNS, DOG (8680)
REGENERATION, POLYAMINE SYNTHESIS (8655)
RIBOSOME, PEPTIDE BOND FORMATION, RAT (8512)•
RIBOSOME DISSOCIATION, MONOVALENT CATIONS, RAT (8651)
RNA CHAINS, INITIATION, 3-METHYLCHOLANTHRENE (8658)
RNA SYNTHESIS, ADRENALECTOMY, METAL ACTIVATION (8640)
SARCOIDOSIS, CHOLESTASIS, ORAL CONTRACEPTIVES (9075)
SARCOIDOSIS, GRANULOMATOUS HEPATITIS, HISTOPATHOLOGY (9106)
SARCOMA, PRIMARY, THOROTRAST (9076)
SCINTILLOGRAPHY, 113M IN ISOTOPE, KUPFFER CELL (8716)
SERUM HEPATITIS, PATIENTS, PROFESSIONAL RISK (9122)
SERUM HEPATITIS, SH ANTIGEN, PREVALENCE (9114)•
SIZE, FUNCTION, BLOOD FLOW, CIRRHOSIS (9164)
SPLEEN, SATURATED HYDROCARBON (8523)
STEATOSIS, ALCOHOL INGESTION, PATHOGENESIS (9111)
STEATOSIS, ALCOHOLISM, DIET, PATHOGENESIS (9110)
STEATOSIS, ALCOHOLISM, PATHOGENESIS (9094), (9095)
STEATOSIS, CHRONIC ALCOHOLISM, ALCOHOL METABOLISM (9154)
STEATOSIS, ESSENTIAL PHOSPHOLIPIDS, SERUM TRANSAMINASES (9099)
STEATOSIS, LIPOGENESIS, PHOSPHOLIPIDS, CHOLESTEROL (8635)•
STEATOSIS, SYMPTOMATOLOGY, THERAPY (9068)
SUBSTRATE AND COFACTOR CONCENTRATIONS, SEASONAL VARIATIONS, RAT (8668)

  SURGERY, MALIGNANCY, INJURY (9079)
  SUSPENSIONS, NADP, NADPH, LOSS (8670)
  THERAPY, CHRONIC HEPATITIS, CIRRHOSIS (9147)
  TISSUE CULTURE, AEROBIC METABOLISM, MAN (8519)

INDEX ISSUE
1970

LIBRARY U. OF I. URBANA-CHAMPAIGN

PLEASE NOTE

DUE TO A CHANGE IN CONTRACTOR FOR THE PREPARATION OF GASTROENTEROLOGY ABSTRACTS AND CITATIONS FROM VOLUME 5 TO VOLUME 6, THERE WILL BE A SLIGHT DELAY BEFORE YOU WILL BE RECEIVING THE FIRST ISSUE OF VOLUME 6. YOU SHOULD RECEIVE THE FIRST ISSUE APPROXIMATELY ONE MONTH AFTER RECEIPT OF THIS INDEX ISSUE.

LIBRARY U. OF I. URBANA-CHAMPAIGN

DESCRIPTION OF INDEXES

SUBJECT and AUTHOR INDEXES for Gastroenterology Abstracts and Citations, Volume 5, are produced from on-line computer print-out of key-punched cards.

The SUBJECT INDEX is based on a hierarchial system of classification in which *major index terms* are modified by one or more *key word descriptors*. The *key word descriptors* are listed in decreasing order of importance and describe the content of the abstract or citation. In addition, in this indexing system, some *key word descriptors* will also be used as *major index terms*, thus providing in-depth indexing of each document. An abstract or citation number, in brackets, will be found after the *key word descriptors*. Abstracts will be identified by an asterisk outside of the brackets.

An illustrative example of this indexing system follows:

INTESTINE, LARGE

Colon, Carcinoma, Radiological Detection, Rectum (0188)*

COLON

Cancer, Polyps, Radiological Detection (0188)*

RECTUM

Cancer, Polyps, Precancerous (0188)*

CANCER

Large Intestine, Detection, Radiology (0188)*

DIAGNOSIS

Radiology, Cancer, Large Intestine (0188)*

LIBRARY U. OF I. URBANA-CHAMPAIGN

umbers followed by an asterisk refer to abstracts in the text. Other numbers refer to citations.

SUBJECT INDEX

- BDOMEN
  - ACUTE, ANTICOAGULANTS, INTESTINAL HEMORRHAGE, THERAPY (8478)
  - ACUTE, ASCARIASIS, PANCREAS (7007)
  - ACUTE, DIAGNOSIS, SURGERY (3738)
  - ACUTE, GASTROINTESTINAL TRACT PERFORATIONS, MORTALITY RATE, ANATOMOPATHOLOGY (9241)
  - ACUTE, INTESTINAL INFARCT (1206)
  - ACUTE, LESIONS, AMMONIA, ULCER (6572)
  - ACUTE, LEUCOCYTOSIS, ACUTE HEMORRHAGE, METABOLIC DISORDERS (9239)
  - ACUTE, PAIN, PANCREATITIS, CHOLELITHIASIS, PYRAZOLONE DERIVATIVE, SPASMOLYTIC, INTOXICATION (5369)
  - ACUTE, PANCREATITIS, ATHEROSCLEROSIS (7688)
  - ACUTE, PANCREATITIS, TRANSAMINASE, CREATINE PHOSPHOKINASE, DUODENAL JUICE, STOOLS (5666)
  - ACUTE, POSTTRAUMATIC (0700)
  - ACUTE, RADIOLOGY, ABDOMINAL VASCULATORY DISORDERS, ANGIOGRAPHY (8763)
  - ACUTE, SYMPTOMATOLOGY, ETIOLOGY, PAIN (9238)
  - ACUTE, TRAUMA, IATROGENIC LESIONS, EMERGENCY MEASURES (9242)
  - AMEBIC DYSENTERY, INTESTINAL COMPLICATIONS, HEPATIC AMEBIASIS, FEVER (6253)
  - ANGIOGRAPHY (4931)
  - ANGIOGRAPHY, GASTROINTESTINAL HEMORRHAGE, AORTA, CAVOGRAPHY, PATHOMORPHISM, BARIUM, GALLBLADDER (4949)
  - AORTOGRAPHY, SURGERY (5359)
  - APOPLEXY, HEMORRHAGE (5387)
  - APOPLEXY, MESOCOLON, HEMATOMA, PURPURA (0455)
  - ATONIA, SURGERY, PREOPERATIVE PREPARATION (6977)
  - BILHARZIASIS, EPIDEMIOLOGY, METEORISM (7008)
  - BLUNT INJURY, ESOPHAGUS, DUODENUM (3729)
  - BLUNT TRAUMA (8462)
  - BLUNT TRAUMA, BILE DUCT AVULSION, CHILD (4581)
  - BUERGER'S DISEASE, INTESTINE, WALL PERFORATION (2996)
  - CAVITY, BILE EFFUSION, CHOLANGIOGRAPHY (3306)
  - CLOSED TRAUMA, PANCREAS RUPTURE, SURGERY, ANTIBIOTIC (2783)
  - DIAPHRAGMATIC HERNIA, CYANOSIS, NEONATE, CONGENITAL (5049)
  - DISEASE, DIAGNOSIS, ANGIOGRAPHY, ISOTOPE SCANNING (7220)*
  - EMBRYONIC DEVELOPMENT, OMPHALOCELE, GASTROSCHISIS (8846)
  - EMERGENCY, METHEMALBUMIN, PANCREATITIS (6940)*
  - ENTEROCOLITIS, CARDIOVASCULAR, STENOSIS, METEORISM (6947)
  - EXPLORATORY LAPAROTOMY, DIAGNOSTIC PROCEDURE, INDICATIONS (8032)
  - FEVER, LYMPHOGRANULOMATOSIS, IRRADIATION, HODGKIN'S DISEASE (6539)
  - FIBRODYSPLASIA, POLYPOSIS COLI, SURGERY (5100)
  - FRONT WALL, PROJECTION OF SMALL INTESTINE, JAPAN (8530)
  - GASTROSCHISIS, GASTROSTOMY, LAPAROTOMY (2954)
  - HIDDEN INJURIES, DIAGNOSIS (7236)
  - HODGKIN'S DISEASE, SURGERY, DIAGNOSIS (4911)
  - IATROGENOUS INJURY, PERFORATION, STENOSIS, JAUNDICE (6221)
  - INTESTINAL OCCLUSION, ADHESIONS, INTRAPERITONEAL ABSCESS (5334)
  - LIVER BIOPSY, LAPAROSCOPY (4063)
  - MASS, NEONATE, RADIOLOGY (6963)
  - OBTUSE TRAUMA, CHOLEDOCHUS RUPTURE (4529)
  - PAIN, AMPULLA OF VATER OBSTRUCTION, PANCREAS (6916)
  - PAIN, CARCINOMA, PANCREAS, STEATORRHEA (6739)
  - PAIN, CONVULSIONS, SHIGELLOSIS, COPROCULTURES, ANTIBIOTICS, MENINGITIS, INFANTS (5740)
  - PAIN, DYSPEPSIA, ULCER, PANCREATITIS (6551)
  - PAIN, INFANCY (7738)
  - PAIN, LIPOMA, OCCLUSION, HEMORRHAGE (6676)
  - PAIN, LYMPHOMA, JEJUNAL MUCOSA, ALPHA GLOBULIN (5346)
  - PAIN, PANCREATITIS, BILIARY LITHIASIS, AMYLASE, LIPASE (5153)
  - PAIN, PANCREATITIS, PANCREATIC CARCINOMA, PSEUDOCYST, TRAUMA, ABSCESS (5144)
  - PAIN, SURGERY (8438)
  - PRESACRAL MASSES, RADIOLOGY, CHILDREN (7489)
  - RADIOGRAPHY, EMERGENCY (4071)
  - RADIONUCLIDE, AORTOGRAPHY, GAMMA SCINTILLATION CAMERA (5671)
  - RECURRENT PAIN, CHILDREN, IRRITABLE BOWEL SYNDROME (6212)
  - SELECTIVE ARTERIOGRAPHY, SAFEGUARDS AGAINST MISUSE (2532)
  - SELECTIVE HYPOTHERMIA, ACUTE PANCREATITIS (7206)
  - STOMACH, DUPLICATION, INTRATHORACIC (4165)
  - SURGERY, LIVER FUNCTION, SERUM PROTEIN FRACTIONS (0579)
  - SURGERY, PREMATURE CORRECTIVE INTERVENTION (9246)
  - TERATOMA, INFANT, RADIOLOGY (4914)
  - TRAUMA, BATTERED CHILD (1517)
  - TRAUMA, DIAGNOSIS, THERAPY (7255)
  - TRAUMA, DUODENAL, ADRENAL GLAND, PANCREAS (6541)
  - TRAUMA, INTESTINAL DAMAGE, SURGERY (7714)
  - TRAUMA, LAPAROSCOPY, PERITONEAL HEMORRHAGE, SCINTIGRAPHY, PERFORATION, SURGERY, HEMATOMA (4909)
  - TRAUMA, LIVER, SMALL BOWEL, STOMACH, PANCREAS (5390)
  - TRAUMA, MECKEL'S DIVERTICULUM (7417)
  - TRAUMA, PANCREATIC INJURY, SURGERY (8232)
  - TRAUMA, PSEUDOMYXOMA PERITONEI, INTESTINAL RUPTURE, CACHEXIA, TUMOR,

- DIGESTIVE DIFFICULTIES (6239)
- TRAUMA, RADIOLOGY, CHILDREN (4920)
- TRAUMA, SURGERY (2231)
- VAGOTOMY, INSULIN TEST, DIARRHEA (3712)
- WALL, ELECTRIC POTENTIAL, ANTRAL-PYLORIC EFFECT (3902)
- WALL, GAS GANGRENE, APPENDECTOMY (1251)
- WALL, HEMATOMA, VITAMIN K (4617)
- WALL ANTERIOR, PHYCOMYCOSIS, INTESTINE (2729)
- WHIPPLE'S DISEASE, CORYNEBACTERIA, DIFFUSE PAIN, FROTHY HISTIOCYTES, ELECTRON MICROSCOPY (5887)*

ABSCESS
- AMEBIC, LIVER (7762)
- AMEBIC, LIVER, GENERAL OBSERVATIONS (2058)
- AMEBIC, LIVER, METRONIDAZOLE, NIRIDAZOLE, DEHYDROEMETINE, CHILDREN (7011)
- AMEBIC, LIVER, RUPTURE, PREGNANCY (7012)
- AMEBIC, LIVER, SCAN (7016)
- AMEBIC, TREATMENT, LIVER SCANNING (3782)
- APPENDIX, HERNIA (5113)
- APPENDIX, MECHANICAL ILEUS, TREATMENT (1252)
- COLON, SURGERY, HEALING (5101)
- DISCONTINUOUS, INTESTINE (LARGE) (0457)
- HEPATIC, DRUG INFUSION, UMBILLICAL VEIN (6039)
- HEPATIC AMEBIC, HEALING RATE, SCAN (7015)
- HEPATIC CHOLELITHIC (4437)
- LIVER, AMEBIASIS, HEPATITIS (2089)
- LIVER, ANGIOGRAPHY, AMEBA (4034)
- LIVER, ANGIOGRAPHY, GRANULOMA (3560)
- LIVER, APPENDICITIS (3494)
- LIVER, ASCARIS (5399)
- LIVER, DIAGNOSIS, CHOLANGIOGRAPHY (2405)
- LIVER, HEPATITIS, NON-VIRAL (1375)
- LIVER, PYOGENIC, GAS, KLEBSIELLA (2336)
- LIVER, SCINTILLOGRAPHY, DIAGNOSIS (4081)
- LIVER, SURGERY (5208)
- PANCREAS, ACUTE PANCREATITIS (2029)
- PANCREAS, SERRATIA MARCESCENS, MAN (1341)
- PERIHEPATIC, INTRAHEPATIC, BACTERIOLOGY (3605)
- SUBPHRENIC, LIVER, SURGERY, RADIOLOGIC DIAGNOSIS AND CONTROL (3614)

ABSORPTION
- ADVANCED AGE, DIGESTION, PANCREAS, SMALL INTESTINE (2964)
- ALPHA-TOCOPHEROL, INTESTINE, MALABSORPTION (3438)*
- AMINO ACID, COLON, JEJUNUM (2342)*
- AMINO ACID, CYSTINURIA, TRANSPORT DEFECT (1963)*
- AMINO ACID, VITAMIN D, ALPHA-AMINO-ISOBUTYRIC ACID (7055)*
- ANTITUBERCULOUS DRUGS, POST-RESECTION, GI TRACT (1899)
- ASPIRIN, SULFONAMIDE, PH, IN VITRO MODEL (5487)*
- ATROPINE SULFATE, N-BUTYL HYOSCINE BROMIDE, SPASMOLYTIC POTENCIES, DOG (0056)
- BICARBONATE, IONS, ILEUM, TRIPLE-LUMEN PERFUSION SYSTEM (3089)*
- BILE, EXCRETION, CARDIOGLYCOSIDE (4479)*
- BILIRUBIN, GALLBLADDER, SURGICAL TECHNIQUE, DOG (3101)*
- CALCIUM, DUODENUM, CHRONIC RENAL DISEASE, RATS (0037)
- CALCIUM, INTESTINE, FASTING PATIENTS (3111)
- CALCIUM, INTESTINE, VITAMIN D3 (6355)*
- CALCIUM, LIVER DISEASE, CHRONIC PANCREATITIS, ULCER, PEPTIC (0035)
- CALCIUM, PARATHYROID GLANDS (6350)*
- CALCIUM, SMALL INTESTINE, LACTOSE, DIET (0034)
- CALCIUM, SMALL INTESTINE, RENAL INSUFFICIENCY (7728)
- CALCIUM, SMALL INTESTINE, RICKETS, VITAMIN D DEPENDENT (3420)*
- CALCIUM, SMALL INTESTINE, VITAMIN D3, STRONTIUM (4775)
- CALCIUM, VITAMIN D, RICKETS, RAT (8555)*
- CARBOHYDRATE (1638)
- CARBOHYDRATE, MEMBRANE PERMEABILITY, DIARRHEA (4870)*
- CARBOHYDRATES, BLOOD CALCIUM LEVELS, MAN (8563)
- CELL TRANSPORT, GASTROINTESTINAL TRACT (5498)
- CHOLESTEROL, METABOLISM (5682)
- COBALT, COMPOUND BOND, GASTROINTESTINAL TRACT, LIVER (3116)
- COBALT, INTESTINE, CIRRHOSIS, HEMOCHROMATOSIS (5072)*
- COLON, EDTA, ULCERATIVE COLITIS (595
- COLON, ELECTROLYTE, PERFUSION, BILE ACID (7060)*
- COLON, VITAMIN B, FLORA (8564)
- COPPER, DOSAGE FORM, ILEUM, NEONATAL RAT (0758)*
- DELAYED-ACTION COMPOUNDS, SIDE-EFFECT (4655)
- DIGESTION, AGE DEPENDENCY, GASTROINTESTINAL TRACT (7849)
- DIGOXIN, PERFUSION STUDY, INTESTINE, RAT (5504)
- DRUG, AGE FACTORS, METABOLISM, RESERPINE (1781)
- DRUG, GASTROINTESTINAL TRACT, FACTOR (3121)
- DRUG, INTESTINAL, MESENTERIC BLOOD FLOW (5501)

DUODENAL CONTENTS, NEW TECHNIQUE, SAMPLING, PATHOGEN, DEMONSTRATION (3311)

DUODENAL SACS, LEUCINE, MUCOSAL TRANSLOCATION, RAT (0060)
DUODENAL ULCER, ANTICHOLINERGICS, GASTRIC ACID SECRETION (1112)•
DUODENAL ULCER, CHILDHOOD (2652)
DUODENAL ULCER, DIETARY EFFECT (0341)
DUODENAL ULCER, SURGERY, VAGOTOMY (5778)
DUODENITIS, MORPHOLOGY, DIVERTICULOSIS (8109)
DUODENOJEJUNAL ANGLE, OBSTRUCTION, HEMODYNAMICS, DOGS (0359)•
DUODENOJEJUNAL JUNCTION, OBSTRUCTION, CONGENITAL (8076)
DUODENUM, ABSORPTION, TRIGLYCERIDES (0032)•
DUODENUM, ADENOMA, BRUNNER'S GLAND (1892)
DUODENUM, ALKALINE PHOSPHATASE, PYRO-PHOSPHATASE INHIBITION, MOUSE (0171)
DUODENUM, ASPIRATES, EPINEPHRINE, SECRETIN (1092)
DUODENUM, BENIGN, TUMOR, GALLBLADDER OBSTRUCTION (0338)
DUODENUM, BENIGN NEOPLASMA, MALIGNANT NEOPLASM, PATHOLOGY, RADIOLOGY (4134)•
DUODENUM, BILE DUCT, CHOLEDOCODIGESTIVE ANASTOMOSIS, LATERAL, TERMINAL, COMPLICATIONS (0666)
DUODENUM, BRUNNER'S GLAND, POLYPOID HAMARTOMA, SURGERY (2607)
DUODENUM, CARCINOMA (5000)
DUODENUM, CHOLECYSTOKININ-PANCREOZYMIN, GASTRIC PEPSIN, GASTRIN, MECHOLYL, INHIBITION OF SECRETIONS (3135)•
DUODENUM, CHRONIC OBSTRUCTION (7359)
DUODENUM, COLUMNAR CELL, RADIOAUTOGRAPHY (7794)•
DUODENUM, CONGENITAL DIAPHRAGMATIC OCCLUSION (6650)
DUODENUM, CYST, BILE, STONES, OBSTRUCTION, PANCREATITIS (4131)•
DUODENUM, DEOXYCHOLATE, REABSORPTION, ILEITIS, TERMINAL (3418)•
DUODENUM, DIVERTICULUM, SURGERY (2673)
DUODENUM, DRAINAGE, SPHINCTEROTOMY (1869)
DUODENUM, DUODENAL PAPILLA, ENDOSCOPY (6517)•
DUODENUM, DUODENOSCOPY, FIBER DUODENOSCOPE, PAPILLA OF VATER, CANCER DIAGNOSIS (3272)
DUODENUM, ENTEROKINASE, LOCALIZATION, RAT (3024)•
DUODENUM, ENZYMES (0741)
DUODENUM, FAMILIAL ATRESIA (6619)
DUODENUM, G-2 POPULATION CELL, CELL DIVISION, MOUSE (2479)
DUODENUM, HERNIA, DIAGNOSIS, RADIOGRAPHY (3278)
DUODENUM, HETEROTOPIC, GASTRIC MUCOSA, HISTOLOGY, PEPTIC ULCER (5826)•
DUODENUM, HISTOLOGY, 5-HYDROXYTRYPTAMINE, MOTILITY (1033)
DUODENUM, INITIAL JEJUNUM, CALCIUM MALABSORPTION, HYPOCALCEMIA (8172)
DUODENUM, ION CONCENTRATION, CALCIUM, MAGNESIUM, PANCREATITIS (4347)•
DUODENUM, INTRAMURAL HEMATOMA, TREATMENT (0278)
DUODENUM, ISOLATED, BRADYKININ, PROSTAGLANDIN E1, MOTILITY, RAT (4797)•
DUODENUM, JEJUNUM, ILEUM, CALCIUM ABSORPTION, LACTOSE, DIET (0034)
DUODENUM, LIPOMA (1079)
DUODENUM, LYMPHOSARCOMA (1091)
DUODENUM, METABOLISM, LYSOLECITHIN (5621)•
DUODENUM, MORPHOLOGY, ENDOCRINE CELL (6284)•
DUODENUM, MORPHOLOGY, VILLUS EPITHELIAL CELLS, MALABSORPTION, CHRONIC ALCOHOLISM (3707)•
DUODENUM, MUCOSA, ABSORPTION, L-ALANINE, SODIUM EFFECT, THORYVELLA LOOPS (5489)•
DUODENUM, MUCOSA, ULTRASTRUCTURE, EPITHELIUM, GOLGI APPARATUS, TRACER STUDY (4704)•
DUODENUM, OBSTRUCTION, CHILDREN, INFANTS, CONGENITAL EMBRYOLOGY (0287)
DUODENUM, OCCLUSION, NEONATE (2617)
DUODENUM, PANCREOZYMIN, CHOLECYSTOKININ, RADIOIMMUNOASSAY (0084)•
DUODENUM, PEPTIC ULCER (1129)
DUODENUM, PEPTIC ULCER, SURGERY (1924)
DUODENUM, PEPTIC ULCER, SYMPTOMS(2650)
DUODENUM, PEPTIC ULCER, VAGOTOMY (1921)
DUODENUM, POLYPOID CARCINOMA, DIAGNOSIS, TREATMENT (1891)
DUODENUM, PRIMARY CARCINOMA (1898)
DUODENUM, PRIMARY CARCINOMA, DIAGNOSIS, TREATMENT (1890)
DUODENUM, RADIOGRAPHY, PULMONARY EMPHYSEMA (1918)
DUODENUM, RUPTURE, TRAUMA (1934)
DUODENUM, SCOLIOSIS, RADIOLOGY, SURGERY (6616)
DUODENUM, STENOSIS, ATRESIA, MALROTATION, MESENTERIC ARTERY (5013)
DUODENUM, STOMACH, ANTICHOLINERGIC (1661)
DUODENUM, STOMACH, BENIGN TUMOR, DIAGNOSIS, SURGERY (2609)
DUODENUM, STOMACH, BICARBONATE RESPONSE, SECRETIN, PANCREAS (3228)•
DUODENUM, STOMACH, PEPTIC ULCER, SURGERY (1904)
DUODENUM, STOMACH, STRESS ULCER, TREATMENT (1911)
DUODENUM, STOMACH, ULCERS, MULTIPLE (0289)
DUODENUM, SUBMUCOSAL HEMATOMA (7419)
DUODENUM, SURGERY (1864)
DUODENUM, ULCER, CLINICAL TREATMENT (2626)
DUODENUM, ULCER, GASTRIC MUCUS, VOSCOSITY (1916)
DUODENUM, ULCER, HEMORRHAGE, SURGERY (1915)
DUODENUM, ULCER, HISTAMINE, SECRETION (4189)•

DUODENUM, ULCER, INDICATION, OPERATION, BETAZOLE TEST (0181)•
DUODENUM, ULCER, OSMOLARITY, INHIBITION, GASTRIC JUICES (3391)•
DUODENUM, ULCER, PYLOROPLASTY, RADIOLOGICAL ASSESSMENT (2610)
DUODENUM, ULCER, SMOKING, BODY FORM (4182)•
DUODENUM, ULCER, SURGERY (1920)
DUODENUM, ULCER, SURGICAL TREATMENT (2651)
DUODENUM, ULCER, VAGOTOMY, APPRAISAL INSULIN TEST (0343)
DUODENUM, ULCER, PERFORATION, VAGOTOMY, PYLOROPLASTY (0350)
DUODENUM, ULCER PERFORATED, TREATMENT, VAGOTOMY (0345)
DUODENUM, ULCERATION, UROLOGICAL SURGERY (2647)
DUODENUM, VAGOTOMY, DISTAL ANTRECTOMY (1900)•
D-XYLOSE ABSORPTION TEST, LIMITATION (8003)•
E.COLI, ENTEROPATHOGENIC (8424)•
ELECTRIC ACTIVITY (3894)
ELECTRIC ACTIVITY, VASCULAR OCCLUSION, GANGRENE, DOG (0049)
ELECTRICAL POTENTIAL, ION, MUCOSA (4803)
ELECTROPHYSIOLOGY, DOG (0775)•
ELECTROPHYSIOLOGY, ELECTROLYTES, VOLTAGE, RAT (0768)•
ENDOMETRIOSIS (7420)
ENTERITIS, CLOSTRIDIUM, DIARRHEA (4884)
ENTERITIS, RADIOLOGY (1959)
ENTERITIS, STENOSIS, CELIAC ARTERY (5069)
ENTEROCOLITIS, CLINICAL CHARACTERISTICS, EPIDEMIOLOGY, SANITATION, CHILDREN (0689)
ENTEROCOLITIS, MUCOSA, REGENERATION, AUTORADIOGRAPHY, HISTOCHEMISTRY, UREMIA, MICE (6248)
ENTEROKINASE, ALKALINE PHOSPHATASE, COLECTOMY (7473)
ENTEROLITHIASIS, RADIOLOGY, MECKEL'S DIVERTICULUM (1958)
ENTEROPATHY, GAS, PORTAL VEIN (8142)•
ENTEROPATHY, MALABSORPTION, MELANOMA (7736)
ENZYME, ANTIGEN, ELECTRON MICROSCOPY (1785)•
ENZYME, CARBOHYDRATE ABSORPTION, MEMBRANE PERMEABILITY (4870)•
ENZYME, CAROTENE DIOXYGENASE, RETINAL (6494)•
ENZYME, DUODENUM, RABBIT (5617)•
ENZYME, LACTASE, INTESTINAL DISACCHARIDES (1782)•
ENZYME, MUCOSA, FOOD LOAD (7827)•
ENZYME, RADIOISOTOPE, TRACE STUDY (0009)•
ENZYME, RETINOIC ACID, INTESTINAL MUCOSA (1783)•
ENZYME, SYNTHESIS, PROTEIN, DNA, RADIOISOTOPE TRACER STUDIES (0162)•
ENZYME ACTIVITY, COLCHICINE, GUINEA PIG (4711)•
ENZYME ACTIVITY, DISACCHARIDASE, MUCOSA, ANTIBIOTIC, PATHOLOGY (2807)•
ENZYME ACTIVITY, HISTOCHEMISTRY, LARGE INTESTINE, MAN, ANIMALS (0752)•
ENZYME ACTIVITY, MUCOSA (2285)•
EOSINOPHILIC ENTERITIS, RADIOLOGY (7722)
EPITHELIAL CELL, ABSORPTION, METABOLISM, CARBOHYDRATES (7989)
EPITHELIAL CELLS, AGE SENSITIVITY, RADIATION (7044)
EPITHELIUM, CRYPT, VILLUS, MITOCHONDRIA, ENZYME ACTIVITY (8513)•
EPITHELIUM, ISOLATED CELLS, METABOLISM (7986)•
EPITHELIUM, MUCOSA, CELL SUSPENSION (5467)
EPITHELIUM, MUCOSUBSTANCE, ENTEROTOXIN STAPHYLOCOCCAL (6672)•
EPITHELIUM, NEUTRAL AMINO ACIDS, JEJUNUM (5500)
EROSION, HEMORRHAGE, POST AORTIC RESECTION, ROENTGENOLOGY (2656)•
EVERTED SACS, GLUCOSE TRANSPORT, O2 AVAILABILITY (6361)
EXTROPHY OF THE CLOACA, MANAGEMENT (2714)
FATS, EMULSIFICATION, GASTRIC LIPASE, TRIGLYCERIDE HYDROLYSIS, PANCREATIC LIPASE, ATP, FATTY ACIDS, MALAABSORPTION (4869)•
FATTY ACID, LIPID, METABOLISM (6493)•
FECAL FLORA, URINARY ORGANISMS, E. COLI (0429)
FERRITIN SYNTHESIS, IRON, BARRIER (8688)•
FISTULA, SURGERY, NONOPERATIVE THERAPY DIET AND ELECTROLYTES (8903)
FISTULA, URETERO-DUODENAL (1881)
5-HYDROXYTRYPTOPHAN DECARBOXYLASE (7035)•
5-THIO-D-GLUCOSE TRANSPORT (7831)•
FLORA, MONOSACCHARIDE MALABSORPTION, BILE-SALT CONJUGATION, INFANTS (0418)
FLUID ACCUMULATION, CHOLERA, INFANT RABBIT (0918)
FOLATE, CONGENITAL MALABSORPTION (6684)•
FOLIC ACID, MALABSORPTION, POLYGLUTAMATES (8938)
FOREIGN BODIES, SWALLOWED (4645)
FREUND'S ADJUVANT, STOMACH, THYMUS, ARTHRITIS (4578)
FUNCTION, MORPHOLOGY, ULCERATIVE COLITIS (6732)•
FUNCTION, STRUCTURE, RICKETS, VITAMIN D DEPENDENT (3420)•
GALLBLADDER, PRESSURES, VAGOTOMY, CHOLCYSTOKININ STIMULATION (1649)•
GALLSTONE, ILEUS (8150)
GALLSTONE, ILEUS, ETIOLOGY, RADIOLOGY (7426)
GASTRECTOMY, FUNCTION, MORPHOLOGY, CONTRAST MEDIA (2597)
GASTRODUODENAL ULCER, PERFORATION, PNEUMOGASTROGRAPHY, DIAGNOSIS, TECHNIQUE (0219)

LIBRARY U. OF I. URBANA-CHAMPAIGN

GASTROENTERITIS, STOMACH, BIOCHEMISTRY (2223)
GASTROINTESTINAL REVERSAL, SURGICAL TECHNIQUES, ADVANTAGES, COMPLICATIONS (1155)
GASTROJEJUNAL FISTULA, PEPTIC ULCER, TREATMENT (1120)
GASTROJEJUNOPLASTY, GASTRIC STUMP, INTESTINAL GRAFT (7338)
GASTROSCHISIS, SURGERY, CONGENITAL DEFECT (6205)
GIARDIASIS, MALABSORPTION (6280)
GIARDIASIS, TREATMENT, CHLORHYDROXYGUINOLIN (1548)
GLUCOCORTICOIDS, STOMACH, COLON (7705)
GLUCOSE-6-PHOSPHATE DEHYDROGENASE ACTIVITY, DUODENUM, MUCOSA, MUSCULATURE, RATS (0160)•
GLUCOSE UTILIZATION, OXYGEN ABSORPTION, JEJUNUM (1587)
GLUTENENTEROPATHY, BIOPSY, DERMATITIS HERPETIFORMIS (7437)•
GLYCINE TRANSPORT, SODIUM, BIRD (4776)
